SUMMARY AND PREFACE.

I. Summary.-The Introduction contains a brief note on the populations of the Puniab Province, as now constituted, and the North-West Frontier Province. Chapter I deals with the Distribution of the Population, and the main point of general interest is the decay of the small towns. Chapter II relates to the Movement of the Population Part I of this Chapter deals with vital statistics, which appear to be wonderfully accurate in the Punjab. The Census figures are also in close accord with the estimate calculated on the rate of in-crease in the 1881-91 decade. This rate was abnormally high, yet the Census figures are only some 570,000 soulb below that estimate Part II of this Chapter deals with the increase and decrease of population. The effect of scarcity on the population of individual Districts has been but slight, even in the case of Hissar, in which District the population has been stationary since 1801, though a more serious result of the famines has been to diminish the due proportion of children, a fact which may retard its recovery for a generation. The condition of the population in Ambala, parts of Karnal and Ludhiana, is unsatisfactory and appears to call for more detailed analysis and local investigation. Part III of Chapter II gives the data for migration, which are more complete than in previous Censuses. The chief point of interest is the loss of population by the sub-montane Districts, due almost entirely to migration to the Chenab Colony which has also attracted large numbers from the rural tracts which are adjacent to it.

Chapter III—Age, Sex, and Civil condition—runs much on the lines of the Census Report of 1891. In dealing with the vexed question of the proportion of the rexes in the Punjab I have not touched on the physiological aspect of the problem, because it is one with which only a specialist could deal. Logically the chapter on caste (VIII) should have preceded this, as the significance of the data can only be realized if the social system of the main Punjab castes is understood. Indeed for this reason the notes on the ages and universality of marriage were relegated to the end of Chapter VIII.

Chapter IV relates to Religion and Sect. The main points to notice are the slow rate at which the Hindu population is increasing in numbers, and the tendency to abandon the older sects for the organized societies of modern times.

As subjects for further investigation may be noted the extent of the Shia influences on the development of modern Mohammadanism in the Punjab, and the form of Hinduism in the south-west of the Province. As regards the latter Dr. Grierson writes:—'The Hinduism of the Southern and Western Punjab has always been condemned by the orthodox Hindus of the Saraswati', and I quote below a passage from his chapter on language, for the general report on the census, which is of interest in this connection.

Chapter V—Education—gives data, which may be of use to specialists relating to the various indigenous scripts.* I have not attempted to discuss the question whether the Urdu, Roman-Urdu or Gurmukhi character is destined to be the universal script of the future in these Provinces or to draw any conclusions from the figures. Similarly in the case of language, Chapter VI, I have had to be content to note a few facts, leaving the deductions to be drawn by the specialist, Dr. G. A. Grierson, C.I.E., who is in charge of the Linguistic Survey and to whom I am indebted for nearly all my information.

The theory that there were two Aryan invasions now stands thus:—" According to the theory, "writes Dr. Grierson, "as it has developed in my hands the Eastern Punjab, Gujrat and Rajputana were originally Aryanized by invaders of the first immigration, but were subsequently covered by a dominant layer of the second invaders, which accounts for the mixed language of the people inhabitating these tracts. This will also well account for the impossibility of drawing a clear line between Punjabi and Lahnda. The mixed character of these languages of the Central and Western Punjab, is well illustrated by the character time given to the inhabitants of those tracts in the Mahabarata and by incidental references in the grammar of Panini. Although not distant from the holy

The Punjab of of

Specimens of these scripts have bren collected and are in the hands of Dr. Vogel, Archaeological Surveyor to the Funjab Government, with whore assistance I hope to publish a complete set of the alphabets in use in these Provinces. A number of specimens were published in 1852 at the end of the late Dr. Leitner's History of adligenous Education in the Punjab.

x ii

Saras vati, the centre from which Sanskritic civilisation spread, we learn that the laws and customs of the Punjab were at a very early period widely different from those of the Madhyadesa. The people are at one time described as living in a state of kingless anarchy, and at another time as possessing no Brahmans (a dreadful thing to an orthodox. Hindu of the middle country), living in petty villages and governed by princes who supported themselves by internecine war. Not only were there no Brahmans, but there were no castes. The population had no respect for the Veda, and offered no sacrifices to the Gods. They were rude and uncultivated, given to drinking spirituous liquor and eating all kinds of flesh. Their women were large-bodied, yellow, extremely immoral in their beháviour, and seem to have lived in a state of polyandry, a man's heir being not his son, but the son of his sister. That this account was universally true in every particular need not be urged. It is given to us by enemies; but, whether true or not, it illustrates the gull in habits, customs and language, which existed between Madhyadesa and the Punjab."

Chapter VII deals with infirmities, and is the most satisfactory I have had to write, the numbers of the infirm showing a marked decrease.

Chapter VIII—Caste, Tribe and Race—is an attempt to describe the organization of caste. In the Punjab the social system appears to be essentially different from the caste system of lower India. The caste is not a social unit, and thus the attempt to classify castes in the order of their social precedence failed. It appears indisputable that the structure of the individual castes must first be thoroughly examined before any attempt can be made to classify the castes. In this, as in the Chapter on the Religion, nothing can be regarded as final until the Ethnographic Survev is complete, and indeed these two chapters can only be regarded as mere notes and queries or rough material for the investigations which have still to be made. And when the fullest possible data have been collected, it will be for specialists to trace the connection between the ancient system and the modern developments of caste.

Chapter IX—Occupations—contains little that is new or of interest. It seems clear that the industries of these Provinces are in a transition stage, but so far we are only at the beginning of that stage and the progress made has had very little effect on the census figures.

2. Preface.—The issue of the Census Tables and Report was greatly delayed owing to the constitution of the new Frontier Province after the ligures had been compiled. It was necessary to reconspile all the Tables so as to give figures for the new Districts, as well as for the new Province, and at the very lowest estimate, this extra work delayed the issue fully two months.

At a future Census it would, I think, be preferable to issue the Census Tables and Report in bulletins or fasciculi, of uniform size, each dealing with one subject. On the present occasion the drafting of Chapter III had to be post-poned for want of the data for emigration to certain Provinces in India, and the chapter had eventually to be written without the (doubtless unimportant) figures from Mysore. Chapters V, VI and VII could however have been issued in October 1901, just as easily as in August 1902. If the suggestion made in section 14, page 7, of the introduction to this report is accepted it should be quite possible to issue the shorter tables with the chapters relating to them within six months of the date of the next Census, and the heavier tables and chapters within the year. Sooner or later a quinquennial Census of India is inevitable. Economic changes must accelerate the movements of the population and necessitate the prompt collection of information regarding them. But if the Census be taken twice as often as hitherto it will be essential to materially reduce the cost, and this could be effected by specializing, recording for example, at one census, occupations, literacy and birth-place, and, at the next, caste, language and infirmities. Under the present system of decennial census we are compelled to ask too much of the people, and of the enumerators, while we collect more material than can well be digested within a reasonable time. Half the value of census statistics is lost unless they are made available within a few months of their collection.

Points like these will however be elaborated in the administrative report and need not be further discussed here.

^{*} Cf. § 18, Chapter III, at page 123 for the doctrines of Guru Gorind Singh, and § 32, Chapter VIII, at page 324 for the democratic organization of the jats.

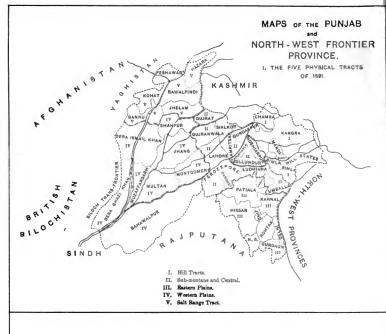

In obtaining full and accurate Census data, I think three officers rendered conspicuous service. Mr. Leslie Jones, Colonization Officer of the Chenab Colony, had a particularly difficult task. The area under his charge was extensive, the population large and unsettled and the administrative staff inadequate. Canal Department could not spare the services of its administrative agency to assist in taking the census so that special arrangements had to be made at short notice, yet the enumeration in the Colony was remarkably thorough and complete. In Gujrat the arrangements under Captain A. C. Elliott, Deputy Commissioner, were as nearly perfect as possible. In Hoshiarpur Mr. P. J. Fagan, Deputy Commissioner, spared no personal trouble to ensure an exhaustive enumeration. In all Districts I believe the arrangements to have been complete and efficient, though the Tahsildars of Jhang and Chiniot were somewhat perfunctory. A feature of the census was the efficiency of the arrangements in the Native States which, without exception, grasped the intention of the instructions and carried them out with great thoroughness and success. In the rural areas in British Territory the enumeration was, on the whole, equally satisfactory. In the towns it was not quite so good, and the three main cities and the larger cantonments caused more trouble and anxiety than all the rest of the Province put together.

In the cities the municipal authorities appeared to be unable to realize the inverse of the work or its difficulties. This was especially the case in Delhi, where, I observe, press of Census work has been advanced as an excuse for neglect of other duties. I can only say that in this case the pressure did not fall on the heads of the municipal administration for disaster was only averted by the exertions of Mr. H. D. Craik, C.S., Assistant Commissioner. In Amritsar Mr. Wood, Assistant Secretary, rendered excellent service, while in Lahore Mr. Johnson, the Secretary, spared no personal trouble, but was ill-supported.

In the Cantonments many officers, of the military as well as of the civil departments, took great pains to master the details of the instructions and make the census a success, but the want of a controlling authority was often felt. In Peshawar, Captain Woodcock, 29th P.1., was appointed to superintend the work in the military part of the cantonment and the success of the census therein is due to his exertions. In Ambala Cantonment, Captain Christie, Cantonment Magistrate made excellent arrangements, as did Captain Waller, Cantonment Magistrate, at Rawalpindi. The work of Captain Brownlow at Multan and Captain Thornhill at Mian Mir also deserves mention. But in the purely military portions of the cantonments the work often devolved upon the already over-burdened Station Staff Officer, who had to deal with a multiplicity of units over which he had no adequate authority. In Rawalpindi Mr. Wilson Johnson, C.S., took great pains to ensure success, but he was transferred at a critical moment, and but for the exertions of Licutenant Hamilton, (now in the Political Department) the results might have been unsatisfactory. It is greatly to the credit of that officer and of Lieutenant Bigg-Wither (in Amritsar) that, though only temporarily employed in the Punjab at the time, they rendered excellent service in the work of the Census.

In the actual work of enumeration, or in matters connected with it, Captain O'Brien, in Peshawar, gave most valuable aid, L. Paire Ram, Revenue E. A. C. in Gujrat, under Captain Elliott, also did excellent work, as did dhai Hota Singh in Dera Ghazi Khan, Lala Hukm Chand in Amritsar, Lala Lachmi Narain in Gurdaspur, Mohammad Aziz-ud-din in Hoshiarpur, Babu Chart Singh in Ferozepur, and Lala Sri Ram in Ludhiana.

It would however be impossible to mention all the officers whose work deserves commendation. A Census depends for its success on the labour of a very large number of workers, both officials and non-officials, whose services it is hardly possible in the nature of things to particularize. A small sum was allotted for rewards to each district; the distribution being left to the Deputy Commissioner or Settlement Collector as the case might be. The sum thus spent amounted to Rs. 12,255, and the money could not have been better spent, indeed one only regrets that it was not larger. Attempts were also made to recognize specially good service by the issue of Sanads under the authority of Government, 4,34 of the first, 4,579 of the second and 8,739 of the third class being granted to census officials in the various Districts and on the railways.

REPORT

ON THE

RESULTS OF THE CENSUS OF THE PUNIAB, 1901.

INTRODUCTION.

I. The Provinces of the Punjab and North-West Frontier.—Under the Proclamation of October 25th, 1901, which appeared in the Gasette of India of the 26th idem, the historic Province of the Punjab was divided into two administrations, the Punjab and the North-West Frontier Province.

The latter Province comprises:-

- the three Districts of Peshawar, Kohat and Hazara as altered by Punjab Government Notification No. 994, dated October 17th, 1901 (which re-transferred the Tahsil of Attock to the District of Rawalpindi from that of Hazara);
- (a) the Bannu and Marwat Tahsils of the District of Bannu (which now comprises these two Tahsils only);*
- (3) the Tank, Dera Ismail Khan and Kulachi Tahsils of the District of Dera Ismail Khan (which now comprises these three Tahsils only),* as altered by Punjab Government Notifications Nos. 992 and 993, dated 17th October 1901 (transferring 31 villages from Tahsil Kulachi to the Sanghar Tahsil of the Dera Ghazi Khan District and two villages from the former Tahsil to that of Leiah).

Thus the North-West Frontier Province comprises all the territories of the former Province of the Punjab which lie to the west of the Indus, excepting the trans-Indus portion of the Isa Khel Tahsil in the District of Mianwali, the District of Dera Ghazi Khan, and the territory occupied by the protected tribes on its western border and known as the Biloch trans-Frontier. The District of Hazara, erst of the Indus, is also included in this Province.

The Province of the Punjab thus now comprises 27 Districts, as against 31 in 1891, 34 Native States, which in turn contain 9 feudatory States subject to them.

The Punjab has now a population of 24,754,737 persons, divided thus:-

British territory, { the 27 Districts, 20,306,252; the Biloch trans-Frontier, 24,087.

Native States, 4,424,398.

The North-West Frontier Province has a population of 2,125,480, divided thus:-

British territory, { the 5 Districts, 2,050,724; the trans-Frontier Territories, 74,756.

2. Average size of Districts.—The District of the Punjab averages 3,600 square miles in area as against 3,573 in 1891, and contains an average population of 752,083 souls or 79,151 more than the average District of the Province

The cis-Indus Tahsils of Bannu (Mianwali and Isa Khel) and of Dera Ismail Khan (Bhakkar and Leiah) rother constituted into the new District of Mianwali by Punjab Government Notification No. 995, dated October 17th, 1901.

as constituted in 1891. The average size of the five regularly-administered Districts of the North-West Frontier Province is considerably less, being 2,737 square miles only with a population of but 410,145.

3. The Districts in order of population .- The regularly constituted

and administered Districts in each Province are given in the margin in order of popu-lation. It is noteworthy that the Chenab Colonisation scheme has already Jhang to the fourth place in the Province. In 1891 it stood twentythird.

Lahore is now, in point of population, the largest District in the Punjab, Sialkot having fallen from first to second place.

The loss of Tahsil Pipli (now the Thanesar Tahsil of Karnal). added to a remarkable decline in population, has reduced Ambala from the third to the twelfth place, Karnal now standing in the eleventh.

4. Tahsils.-Each District in these Provinces is divided into subcollectorates or Tahsils, which now number 131 in all, as against 128 in 1891, the four Tahsils of Khangah Dogran, Lyallpur, Samundri and Toba Tek Singh in the Chenab Colony having been constituted since that year, and that of Doaba Daudzai in the Peshawar District having been abolished.

In the Punjab the number of Tahsils in a District is on an average four, but the numbers vary from three in the smaller or more compact Districts to seven in the large District of Rawalpindi.

In the North-West Frontier Province the District contains on an average three Tahsils.

5. Revenue Divisions .- The 27 Districts of the Punjab are now grouped, Delhi. Jullundur. Lahore. Rawalpindi. Multan.

under Punjab Government Notifications Nos. 1464 and 1465, dated 7th November 1901, into five administrative Divisions or

Multan. Commissionerships, but, as in 1891, no statistics have been compiled for Divisions because in actual official work they are not required. The Native States still comprise about one-third (or 98ths) of the total area of the Punjab, but they contain less than one-fifth of its population. The range of diversity in their populations increases as the larger States advance, Darkoti with its population of 518 (as against 595 in 1851) being in marked contrast to Patiala with a population of 1,596,692 (as against 1,583,521 in 1891).

Divisions which is given in the margin is based upon one formulated by the Government of India, but with some modifications. The maos opposite page I illustrate both the present scheme and Mr. Maclagan's division into five tracts, which unfortunately was based on an entirely different principle to that on which the Government of India scheme was drawn up. The Punjab does not lend itself very readily to such grouping. The Salt Range forms a naturally distinctive feature but dove-tails into the administrative Districts of the Himalayan Submontane on the one hand and those of the North-West Dry Area on the The Himalayan ranges rise so gradually that it is difficult to say where the Himalayan Area begins the Sub-Himalayan ends. The Indo-Gangetic Plain West is fairly well defined on its western side by the Rajputana Desert, but Hissar and the adjacent parts of Jind are not unlike Bikanir or the Bahawalpur uplands, and were indeed classed in the Government of India scheme as in the North-West Dry Area and not as now in the Indo-Gangetic Plain. The present scheme however fits in with the one adopted in the North-West Provinces, and the Himalayan Division exactly corresponds to the Hill Tracts of 1891. The objections to be urged against it are obvious,

but any other scheme would seem to be equally open to criticism.

7. The dates of the successive enumerations.—The enumeration to which this report relates is the fifth which the Punjab has undergone. Writing in 1892 Mr. Maclagan said:—

"A Census of the Province was taken for the first time (at least since the days of Akbar) on the night of December 31st, 1854, and January 1st, 1855, under the superintendence of Sir Donald McLeod, then Financial Commissioner. The instructions for taking the Census will be found in the Financial Commissioner's Circular No. 66, dated 31st October 1854, and the report on the results by Mr. Richard Temple, Secretary to the Punjab Government, is printed in Volume XI of the Government of India (Foreign Department) Selections.

The Punjab Government was anxious to take another Census in 1864, but the Government of India disallowed the proposal, on the ground that a partial Census relating to the Punjab only, and not to the rest of India, was open to objection.

The second enumeration actually took place on the 10th January 1868, and was conducted under the orders of Mr. A. Roberts, Financial Commissioner. The instructions relating to it are to be found in Volume VII (1869) of the Circulars of the Financial Commissioner, Punjab. The report on this Census, submitted by Mr. J. A. E. Miller, Secretary to the Financial Commissioner, was published with the returns in a thin folio in 1870.

No Census was taken in 1871, but a return of persons born in Britain was prepared on the 15th June of that year and forwarded, for submission, to the Home Authorities.

The third Census, which was the first to be conducted with adequate thoroughness and detail, was taken on February 17th, 1881, under the superintendence of Mr. D. C. J. libbetson, and the report on the results together with the tables was published in three large volumes in 1883."

The fourth Census was taken on February 28th, 1891, under the supervision of Mr. E. D. Maclagan whose report was published in 1892.

The recent Census was not strictly synchronous, Spiti and Lahul having been enumerated on September 21st, Chamba, Lahul on November 1st, and Kanawar, in Bashahr, on December 22nd, 1900. The object of thus taking the census of these hill tracts in the closing months of that year was to avoid any delay which might have been caused had the passes not been open till late in the year 1901. The final census of the rest of the Punjab (including the whole of the present North-West Frontier Province) was taken on the night of March 1st 1901.

8. Alterations in the area of the British Territory.—Between 1849, when the Punjab was annexed, and 1881, no actual changes in the boundaries of the Province occurred. In 1891, the territories of the feudatory States of Rawain and Dhadhi in the Simla Hills, which had in 1881 been included in the Simla Hill States, were enumerated as part of the British District of Simla, but in 1901, these States, having been declared feudatories of Jubbal, were again included in the Simla Hill States. Their area is only 32 square miles and their population 1,970 souls.

As in 1891 certain Biloch tribes on the Dera Ghazi Khan border under the political control of the Punjab Government were enumerated. Their country appears in the Census Tables as the Biloch Trans-Frontier, but its area is ill-defined and has not been estimated.

In the present North-West Frontier Province, the Census of 1901 was extended to the Kurram Valley, which has an area of some 1,278 square miles and a population of 54,257 souls. The Valley came under British Administration in 1893. The Shiranni country, on the borders of Dera Ismail Khan, which had been virtually under the political control of the British Government since annexation, was also enumerated. It has an area roughly estimated at 1,500 square miles with a population of 12,371 souls.

It was not deemed expedient to extend the Census to the trans-Indus territories of the Nawab of Amb, or to any other trans-frontier territory not included in the military posts of the Malakand, Dir, Swat and Chitral, Wano and a few minor posts.

- 9. The methods of the Census of 1901.—As regards the actual method of no general interes: The Punjab Census Reports for 1881 and 1891 contain the fullest possible accounts of the methods by which the Census was taken then, and in the recent enumeration those methods were closely adhered to, with, I believe, the best results. There is 'internal evidence' in the Census Tables that the enumeration was complete and accurate and for this result the credit is solely due to those who had to give effect to the instructions, which were merely a codified version of those issued for the previous enumerations.
- 10. The provisional totals.—A new feature of the Census of 1901 was the rapid local compilation of the figures for the population, by sexes, with the number of occupied houses. By a systematic totalling of the numbers in each block, (the smallest Census unit), then of the numbers in each Circle, Tahsil and District, the actual population of the Province was provisionally ascertained within a week of the final Census. These totals were called the provisional totals, the figures for the population being subject to final test in the central compilation offices after the Census results had been abstracted at leisure.

The accuracy of the provisional totals was satisfactory. Excluding the Malakand, Dir, Swat and Chitral, the final figures give the population, in

British Territory, of the Punjab (including the present North-West Frontier Garatte of India, Home Department Noticeation Province) as 22,447,691 or 1,793 less than No. 34–51, dated the 19th March 1901. The provisional totals, an error of 1008 per cent. In the Native States the finals are 4,424,308, being 14,418 or 3 per cent. less than the provisional totals, the error being chiefly due to a blunder in the Simla District Office. I may, however, note in passing that absolute accuracy could and ought to be attained at a future Census. The mistakes made in totalling were solely due to neglect of the instructions issued, and as that process could be further facilitated there is no reason whatsoever why the preliminary totals should not be as exact in every District and State as they were in the District of Jhelum and the States of Nabha, Maler Kotla, Mandi, Suket, Pataudi and Faridkot, in which the provisional and final totals agreed. In Montgomery there was only a difference of one, while Rohtak, Gujranwala and Delhi came within 60 of the final totals.

- 11. Abstraction, Tabulation and Compilation.—After the provisional totals, for which the local authorities were responsible, had been compiled, their functions ceased, all the books of schedules being sent to centres for abstraction, tabulation, and the compilation of the Census Tables. In order to make clear what follows it is necessary to define these three terms.
 - (i) Abstraction, under the new 'Slip system,' consisted in re-producing all the particulars (save those for infirmities), relating to each person on a slip of paper. In order to minimize the amount of copying coloured slips were used, the colour denoting the religion of the person whose entries were abstracted, white or bleached paper being used for Hindus, brown for Mohammedans, red for Sikhs, and green for all other religions. Further 'civil condition,' i.e., the entry of 'unmarried,' 'married' or 'widowed,' as the case might be, was denoted by a symbol, and this symbol was shaded to denote ande and left blank to denote female. These symbols were lithographed on slips of the different colours and the abstractor by selecting a slip of the proper colour and symbol at once reproduced three of the most important particulars relating to the person whose entry he had to copy, so that only the remaining data had to be actually written on the slip. When the slips for each unit, which was in this Province the thana or Police circle, had been completed the process of tabulation commenced.
 - (ii) This process precisely resembled the sorting of a number of gigantic packs of cards. Each pack consisted of a number of slips of four colours, and by sorting out each colour four suits, one for each religion, were obtained. By further sorting of the symbols in each suit, six packets, each denoting a sex and a civil condition, were made, and thus we had the numbers of—
 - (s) unmarried, males and females

for each religion in the unit. It will be readily understood that by further sorting the age-periods, occupations, language, birth-place tec., were similarly tabulated for each unit.

Of abstraction and tabulation there is, or ought to be, no attempt to finally arrange and classify the data for the various tables. Thus these two processes are almost purely mechanical, and the object in abstraction should be to reproduce with absorbate accuracy the schedule entries, while in tabulating there should be no 'lumping together' of figures whose meaning is not perfectly clear. For example, if an occupation is returned the exact nature of which is not clearly known and which cannot be traced in the standard list of occupations, its figures should be given separately and its classification left to the compiling staff.

- (iii) Lastly, compilation consists in totalling up the figures returned for each unit for the District Tables, in totalling the latter figures again for the Provincial Tables, and in finally classifying and arranging those data for the press. Compilation is thus the most difficult and intricate of the three processes. It can only be effected economically and accurately by a highly qualified staff. On this occasion the abstraction was done almost entirely by non-officials, under official supervision, and indeed many of the best abstractors were boys straight from school. By employing non-officials we were able to avoid calling away officials in large numbers from Districts and thus dislocating the ordinary work of administration. Tabulation is somewhat more difficult but it is not a lengthy process. It can be done by non-officials who have been found competent in the work of abstraction. Compilation can only be done by trained men.
- 12. The old system of tabulation as contrasted with the new .-Under the old system of tabulation there was no abstraction of the Census entries in the sense in which that term is used above. The process called abstraction in 1891 was in reality the first stage in that of tabulation and consisted in ticking off on abstraction sheets every particular in the Census schedule, or as Mr. Maclagan describes it :- "the abstractor takes up an enumeration Ponjab Census Report, 1892, Section 74, page 44, book and a blank abstraction sheet, and makes an unright line in the respect column of Preliminary note. makes an upright line in the proper column of the latter for each item relating to the sheet in question which he finds in the enumeration book." The great objection to this process was the difficulty in checking the results. This could only be done, in the case of the most complicated tables, by re-abstracting and testing the results of the first abstraction by those of the second. But under the Slip system, when once the slips have been written, tabulation becomes extremely easy and rapid. It only remains to count the slips, or the slips containing any given entry, and enter the result on a tabulation sheet. To take a concrete example, suppose it is desired to find the number of immigrants in Lahore from each District or State in India. Under the old system there was an abstraction sheet with a set of columns, one column for each District and State, and on this the abstractor made a tick in the appropriate column for each entry of a birth-place not in Lahore. Then he totalled the ticks and found the number of immigrants. To check his totals the only possible method was for a second abstractor to go through this process independently. If their results agreed, they were doubtless correct. When they did not it was impossible to say which was correct without a third abstraction. But with the slip-system the slips could be sorted into as many heaps (only) as there were Districts or States of birth-place returned. Then each heap was counted and the totals added together gave the total population of the unit. If they did not it was only necessary to re-count the slips, as the mistake could only be in the counting—unless slips had been lost. Further check of the total for each District or State was simple. It was quite enough to take up the heap for each unit, and see that it contained no slips save those bearing the birth-place entry of that District or State. There was no need to re-sort or, if the totals agreed, to re-count. Hence the great merit of the slip-system lies in its extreme accuracy. But it has another important advantage in that retabulation is facilitated. For example, suppose we wished to ascertain the number of literate male Hindus employed as clerks in Jhang. Under the old system this would have involved going through all the schedule-entries of that District. But under the new system it would only necessitate the sorting out of the relevant slips from the packets for male Hindus. As in the Punjab the tabulation of caste and tribe is exceedingly intricate, it was arranged that the slips should be sorted last of all into caste-bundles (preserving the ageperiod groups as well), so that we were enabled to obtain any data for any caste or sub-division of a caste, after the Tables had been compiled, with very little labour or expense.

13. Check on the correctness of the slips and payment of abstractors. The abstractors worked in gangs or sections, each gang under a Section Superintendent. Each section took the book of schedules belonging to a Tahsil, or city, and as far as possible a Field Qanungo belonging to that Tahsil was placed in charge of the section. It is one advantage, and a very great advantage, of the Slip System that the abstractors can be paid by the piece. The rule was that two annas would be earned for every 100 slips "correctly and legibly written," and it is essential to make it clear from the outset that incorrect or illegible slips will not be paid for. The rules finally evolved were that the amount paid was reduced to 1½ annas if one mistake was detected in a 100 slips, and to I anna if two mistakes were detected. If more than two mistakes were found no further examination of the slips was attempted but the whole of them were returned to the abstractor for scrutiny. When he had properly checked his entries he was allowed to bring them up again for inspection. There was no hardship in this course. Check of the slips written bid fair at the commencement to cost rather more than the actual abstraction. As long as a man knew that he would be paid for every 100 slips produced, whether accurate or not, he was quite ready to make any number of mistakes and let his Section Superintendent make the corrections required. Checkers were tried but the system broke down. If a checker is paid a fixed salary he has no inducement to detect errors, and fines are out of the question. Besides that, who is to check the work of the checkers? If the Superintendent is to do it he derives very little help from the checker. On the other hand the payment of a fixed sum for every error detected by a checker led to increased inaccuracy for the checker sometimes altered correct entries so as to make it appear that mistakes had been made or even colluded with the abstractor who made incorrect entries, which the checker was paid for detecting, the abstractor receiving a share of the amount thus dishonestly earnt. We finally enforced the absolute responsibility of the Section Superintendent for the correctness of his abstractors' work. The Superintendent had no difficulty in securing absolute accuracy from his abstractors because inaccurate work was not accepted or paid for. No margin of error was allowed and the correctness of the entries after the first few days was remarkable.

14. The possibilities of the next Census .- I have dwelt upon these details because I think that at the next census it will be, if not absolutely necessary, at least desirable to decentralize the work of abstraction and tabulation. My original scheme was to have a large central office at Lahore. In working a new and, in India, untried system it was obviously best to have the whole of the work done in one place, where it could be personally supervised. Unfortunately, it was not possible to obtain office-room for 1,500 abstractors-the number I hoped to obtain-in any one place, and the office had to be split up into three main branches, at Lahore, Multan and Rawalpindi, with small local offices at Kangra. Kulu and Simla. This arrangement combined all the disadvantages possible. It was neither centralization nor decentralization. It was also costly as abstractors could not be obtained in large numbers locally and officials and non-officials had to be brought in from the out-lying Districts. It further involved the renting at Lahore of a large hall which was quite unsuitable for the purpose; and though we had the use of the old fort at Multan free of charge, the cost of the necessary repairs had to be met. Moreover, we had to bring all the books of schedules into the abstraction centres, and as time was a consideration they had to be sent in by passenger train. This cost a good deal though the North-Western Railway administration conceded us special rates. Assuming then, that the next Census is effected on schedules, as in 1901, and that the entries have to be abstracted on slips, there would be a very great saving in having this purely mechanical process done at the head-quarters of each District. An official of the rank of Naib-Tahsildar might be deputed to supervise the work under the control of the District Census Officer, Provided sufficient office accommodation could be obtained,

[.] The fort will hardly be in a repairable condition in 1911.

larger numbers could b

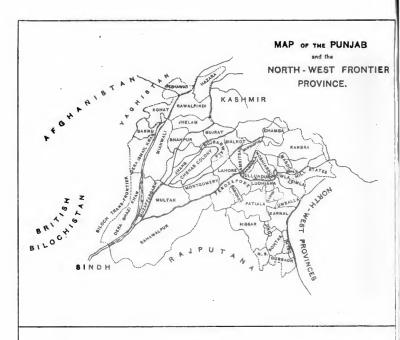

8

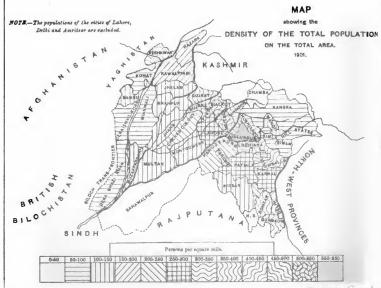

larger numbers could be put on than it is possible to collect in central offices for every candidate or other non-official available could be employed, an official of the status of a Field Qanungo, or a selected patwari being made superintendent of each section of the office. The task of copying the schedule entries on to the slips is so simple that there is no justification whatever for again incurring the great expense of large central offices at this stage. There should also be a considerable saving of time. It is hardly possible to get the work of abstraction in central offices into full swing in less than a fortnight from the date of the Census, but in District offices it could be commenced within a week. The written slips could then be counted and sent into a central office.

But I would certainly go a step further. Assuming that the next Census is taken in February or March and that abstraction would take two months, this, the first stage of the work, would be completed by the end of April or early in May, by which time the touring season is over, and the District staff should be able to undertake the second process of tabulation. I would then have the tabulation sheets sent in to a central office at Lahore. This office should consist of a comparatively small number of trained men, accustomed to deal with statistics. The great defect in the working of the recent Census was the weakness of the compilation office, which has not only to classify the tabulated data, and prepare the tables for printing, but to calculate the intricate Subsidiary Tables, appended to each Chapter of this report. On the present occasion, the difficulty of these tasks was greatly under-estimated, and far less time would be spent on them if a thoroughly qualified staff were obtained.

I have said, assuming that the next Census is effected on schedules and that the entries have to be abstracted, as in 1901, on slips, because I think the next Census will be taken on slips and not on schedules at all. Clearly if it were possible to take the census on slips, written on one side only, there would be no abstraction to do and tabulation would commence at once, thus effecting an enormous saving in time and money. That there would be difficulties in recording the data on slips instead of a schedule cannot be denied, but the saving of the whole cost of abstraction would justify a little extra expenditure in order to substitute enumeration-slips for schedules, though personally I believe that slips could be issued, in booklets with a foil and counter-foil, for rather less money than is spent on schedules. However, this is not the place to discuss technical details.

15. The cost of the Census.—A note on the cost of the Census is given in appendix to this report, as the accounts could not be finally made up in time to permit of its being given here.

CHAPTER I.

DISTRIBUTION OF POPULATION,

PART I .- DENSITY OF THE POPULATION.

I. The bases of calculation.—Density of population may be expressed in several ways. We may calculate the numbers of the total population to each square mile of the total area, and this is the method most commonly adopted in Europe. Or we may calculate the incidence of the population on the culturable and cultivated areas, or, again, we may take the rural population alone and discuss its incidence on one or other of those areas or on the total area. All these methods have been used in former census reports and each has its advantages. I propose, however, on this occasion to confine the discussion, as much as possible, to the figures for density on the total area and the area under cultivation, stating, as a rule, the incidence of the total population on these areas. This will simplify the discussion and may be justified by the following reasons:—

The distinction between rural and urban population must always be a somewhat arbitrary one, especially in provinces, like the Punjab and North-West Frontier, which contain no great manufacturing centres and export little but agricultural produce. No doubt the cantonments in these Provinces and the cities of Lahore, Delhi and Amritsar contain an essentially urban population, but all the towns are more or less dependent for their existence on the agricultural communities around them. Indeed it may be said that the smaller towns are merely large villages with markets for the interchange of local products and, in the main, of local manufactures. It is difficult to realize the extent to which the entire population of these Provinces depends on agriculture. The riches of England are mainly derived from foreign trade and are not seriously diminished by agricultural depression, whereas, in these Provinces, the land is practically the sole source of wealth, and their population whether classed as urban or rural is indirectly or directly dependent on the produce of the soil. It is, therefore, somewhat misleading to set aside the urban, and discuss the pressure of only the rural, population on the land.

The incidence of the population on the culturable area would be of interest and importance if we could define "culturable land" to mean "land immediately available for cultivation without the outlay of capital", but, as Mr. Maclagan has pointed out, the term "culturable" is a purely conditional one. Given certain physical conditions and the requisite amount of capital vast areas now waste may become capable of cultivation in a generation or two, but whether those conditions exist and whether the results would justify the outlay is sometimes a subject of controversy. In the absence of separate data for the amount of land actually available for cultivation at the present time as distinguished from the areas which may conceivably in a few years be rendered culturable, figures expressing the incidence of the population on the areas so returned would appear to have little or no practical value. The density of population on the area under cultivation undoubtedly gauges pretty accurately the intensity of the pressure on the soil, but even density so calculated can only be accepted with certain qualifications. The area under cultivation is no doubt almost constant, but the area cropped fluctuates considerably from year to year and in periods of famine is far less than that returned as cultivated. That these considerations are of importance will appear from the following figures:—

Assuming that the average population during the past decade was the mean of the population enumerated in 1891 and 1901, it will be found that in British territory the average area under cultivation was a little under an acre and one-fifth per annum to each unit of the population, but the area of the crops harvested Land Revenue Adminis. Was barely an acre per head.† The latter area aver-

Land Revenue Administration Report of the Pressure 32,091,637 acres per annum in the ten years 1890-91 in 1893-990, para. 5 to 1893-1900. In 1892-93 it had stood at 25,732,864 acres, the highest figure ever reached, but it fell to 18,515,957 acres in 1896-97, and after rising in 1897-98 to 25,810,142 acres it again fell fin 1899-19co to 14,993,753 acres, the largest area of current fallows (in which the area of failed crops is included) ever recorded having been returned that year. In other

words the cropped area of 1899-1900 was 32 per cent. below the average throughout the Provinces, while in the Districts most affected by the famine the proportion was far worse, and thus in those Districts the incidence on the cultivated areas returned gives a very exaggerated idea of their prosperity.

On the other hand the incidence on the cultivated area is often apt to mislead us by giving an inadequate idea of the resources of the people. In many parts of these Provinces, and more especially in the Himalayan, sub-Himalayan and South-Western districts agriculture is to a certain extent subservient to stockraising, but the areas under pasture are not included in the returns of cultivated or even, for the most part, in those of the culturable area. In so far then as pasture-land is included in the total area the figures for incidence of the population calculated on the latter are of great practical value. In the case of a District like Kangra a high incidence on cultivation does not imply undue pressure of population on the soil because the reserves of grazing-land are immense, whereas in Jullundur, where cultivation has probably reached its limit and there is no land left for grazing, the incidence on the cultivated area is virtually the sole index of the agricultural resources of the people.

The Subsidiary Table I-A., at the end of this chapter gives the density of the total population on the total area in 1881, 1891 and 1901, with the variations since 1881 and 1891. The present density is further illustrated by the map opposite page 9. The first map opposite page 12 illustrates the density of the total population on the cultivated area. Subsidiary Table 1-B., gives the density of the rural population on the total and also on the cultivated areas in 1891 and 1900, and the second map opposite page 12 illustrates the density of the rural population on the cultivated area in 1901.

2. Density on the total area .- The Provinces of the Punjab and the North-West Frontier combined have a density of 180'5" persons to the square mile, or in other words there are 31 acres of land to each person.

In British Territory the density is 1998 as against 121, in Native States Territory.

3. Density by Natural Divisions.-The Natural Divisions stand thus in order of density :-

Indo-Gangetic Plain West	***	•••	***	•••	315.8
Sub-Himalayan	•••	***	***	•••	300.3
North-West Dry Area	•••	•••	•••		97
Himalayan	•••	***	•••	•••	76.7

the two former having thrice the density of the North-West Dry Area.

4. Density in British Districts.—The District of Jullundur remains the most densely populated in the Province and but little change has occurred in the relative densities of the congested Districts as the figures in the margin show.

The most sparsely populated District in the Province of the Punjab is the new District of

Mianwali with a density of 54'3 only to the square mile, and excepting the

^{*} Excluding the population enumerated in the Malakand, Dir, Swat and Chitral, in the Biloch trans-Frontier and in the Shirani country. The latter has an estimated area of 1,500 square miles and including it the Provinces have a density of 178 persons to the square mile.

In the North-West Frontier Province the density is only 1407 whereas in the Punjab (British Territory) it ls 208 9 or 48 per cent. greater.

Hill Districts of Simla and Kangra no other District east of the Indus has a

density of less than 100. West of the Indus the density is high only in Peshawar and in three Districts it falls below 100, while the Kurram Valley has the low density of 42, which is however

higher than that of the Chamba State where there are only 40 inhabitants to the square mile.

The 27 Districts of the Punjab, as now constituted, may be thus classified according to density :-

Exce	eding 600 pe	rsons t	the squ	are mile	two :-	Jullundur and Amritsar.
With	500—600	29	31	**	two :-	Sialkot and Delhi.
**	400-500	"	**	"	four :-	Gurdaspur, Ludhiana, Ho- shiarpur and Ambala.
"	300-400	19	"	"	four :—	Gurgaon, Gujrat, Rohtak and Lahore.
25	200—300	"	**	"	three :-	Gujranwala, Karnal and Ferozepur.
"	100-200	**	**	3)	eight:—	Rawalpindi, Jhang, Hissar, Jhelum, Multan, Muzaffar- garh, Shahpur and Mont- gomery.
"	less than 10	,, 00	"	92	four :—	Dera Ghazi Khan, Kangra, Simla and Mianwali.

The Chenab Colony has already a density of 213.6 inhabitants to the square mile, being nearly as densely populated as an ordinary District.

5. Density by Tahsils.-The Tahsils which contain a city or large town

show a very high density. and in order to compare the density of their rural areas with other Tahsils it is necessary to exclude the population of cities and large towns with their cantonments. The results of each method are given in the margin for comparison.

The inclusion or exclusion of the population of the small towns, which moreover contain a large agricultural element, does not materially affect the figures of density in Tahsils. Including then all population, except the that in the cities or large towns, we find that the fifteen Tahsils noted in the margin have a density exceeding 500 persons to the square mile.

In 1891 Rupar Tahsil had a density of 5116, Pasrur has also fallen from 522'7 to 491,

Native State	0.	Density.	Adjacent Bri Distric	itish t.	Density.

6. Density in Native States .- As a rule the Native States are not so densely populated as the British District of which geographically they form part or which they most closely resemble in physical characteristics. The excep-tions are Maler Kotla, which in spite of the fact that it has

no canal irrigation slightly exceeds Ludhiana in density, and Pataudi which is more densely populated than Gurgaon. The figures for certain States are given in the margin.

The Phulkian States are so scattered that comparison of their densities with those of any British District would be

Patiala Jind 205

of little value. Taking the three together they have a density equal to that of the Indo-Gangetic Plain

West in which they lie. The Hill States of Mandi and Suket (141) and Nahan (113) show a some-

what high density for hill territories.

7. The Districts in order of density on cultivation .- Taking the whole

population, except that in the cities, the Districts which show the greatest pressure on the area under cultivation are given in the margin, with the place each occupies among the congested Districts given in paragraph 4 above. The 27 Districts of the Punjab are arranged in the order of

the density thus calculated, those of the North-West Frontier Province being given in their proper places, without numbers, in italic.

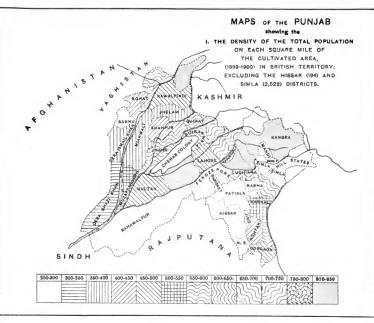

Putting aside Simla and Montgomery in which the conditions are quite exceptional, it will be seen that the submontane District of Hoshiarpur has the greatest apparent density on the area cultivated, but the Siwaliks afford considerable grazing, whereas in Jullundur there is practically no pasture, and the actual pressure on the soil is probably far greater in that District than in any other. Kangra (and, in the North-West Frontier Province, Hazara) have great resources in their forests, which contain extensive grazing grounds, and cannot be looked upon as densely peopled, while even the thickly populated Districts, Sialkot, Gurdaspur, and Amritsar, come a long way after Jullundur.

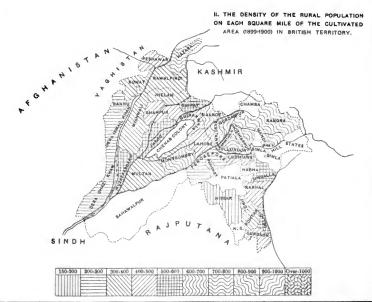

Of the 27 Districts of the Punjab the eight above mentioned have a density of over 700 persons to the square mile of cultivation, yet only 5 of them can be

15.	Karnal	4+4	***	***	***	505	

regarded as actually congested. Ambala with 684 persons to the cultivated square mile comes next in order. As will be seen later its population has decreased in a remarkable way, but it remains a congested District. Six Districts have a

density of cultivation of between 500-600 persons, but they can hardly be regarded as seriously congested, though Delhi and Ludhiana may be so classed as they have little waste land left for grazing or extension of cultivation. The

Deputy Commissioner of Delhi does not, however, consider the District over-populated, for he writes:-

"In an average run of years an ordinary zamindar family consisting of seven persons, when we take the nature of the crops, ordinarily sown, and prices into account, should be in a position of comfort and able to save. The exceptions to this rule are to be found in the Dabar Chak in the Delhi Tahsil and in the riverain and Barani tracts of the Balabgarh Tahsil."

Of the seven Districts with a density of 400—500 none would appear to be congested. The Deputy Commissioner of Gurgaon, however, says:—

"The great increase in the pressure of the population on the soil has been attended by no change in the system of agriculture, and there has been no introduction of new industries. Yet even in 180 the Settlement Officer thought the District was unable to support a larger population than it then had. He was probably right and the District is now dangerously over-populated."

The pressure is nominally least in Hissar, but in that District the area harvested has, unfortunately, generally been but a fraction of the area under cultivation during the past decade.

turable areas in British Terri. tory .- The densities of the rural population on the cultivated and culturable areas in the two Provinces and in each District are given in the margin, the Districts being arranged in the order of the . density of their population on the cultivated area. The number affixed to each shows the place it occupies in the order of the density of the total population on the cultivated area as given paragraph 7 above. It will be observed that the order of density is but little changed by excluding the urban population of the towns. pressure of the rural population on the area under cultivation is very great in

Jullundur. It is also heavy in the districts which show a high density in paragraphs 4 and 7 above, so that, in considering relative density, it is almost immaterial whether we exclude the urban population of the towns or not.

9. Congestion of the population.—The density of the population has been exhaustively discussed in former Census Reports, but I am unable to trace

any definition of the term Punjab Census Report, 1883 Ditto ditto 1892 'congested,' or any final

conclusions as to which tracts are to be regarded as congested, and indeed full discussion of these points would be beyond the scope of a Census Report.

If we define 'congestion' to mean an accumulation of population in excess of the numbers which the soil would support, the question whether any given District is congested would involve inquiry into the fertility of the soil, the amount and distribution of the rain-fall, and the character of the people. Fortunately for the Punjab the enterprising spirit of the mass of the population and their readiness to emigrate from the densely populated tracts, even to countries beyond India, prevents any actual congestion, though most of the Districts which show a high rate of density are probably always on the verge of it. Where the people lack this spirit other measures are taken, as we shall see later on, to prevent over-population. There can be little doubt that Jullundur, for example, would soon be hopelessly congested, but for the character of its Jat population which seeks service in or out of India with equal readiness, while the Himalayan States could not support a rapidly increasing population which refused to emigrate, and would soon be congested but for the custom of polyandry.

10. Comparison with European countries .- The marginally noted com-Density per

parisons with the density in European countries may be of interest, though the conditions of our Indian Provinces are so different from those in European countries that little practical value can be attached to the comparison.

PART IL-THE POPULATION IN TOWNS AND VLLIAGES.

II. 'Town' defined .- A town has been defined to include any municipality, civil lines, or cantonment, and any place, with a population of not less than 5,000 inhabitants, which has urban

Articles to and 11, Chapter I of the Punja's Census Code.

Act XX of 1891. Section 210 provides that a purely agricultural village shall not be declared a Notified Area.

characteristics. In order to facilitate comparison with the figures of 1891 certain towns, then municipalities, but now Notified Areas under the Punjab Municipal Act, have been retained in the list of towns in Table IV.

12. Distribution of the population between towns and villages,-

The proportion which the Percentage of rural behulation. rural population bears to the

		IgoI.	1891.	1881.
British Territory	 ***	† 88'44	88:43	87.06
Native States	 ***	89'51	89.29	88-78

constant, the slight tendency of the urban to increase faster than the general population, observable in 1891, having virtually disappeared. There is no trace in these Provinces of that

whole remains remarkably

+ Subsidiary Table II-A, lines 2 and 4, columns 4 and 5.

general movement of the population to the towns which is so marked in Western Europe, though there is perceptible movement towards the cities.

13. The number of Towns.—The total number of towns in British Territory has risen by 13, from 178 in 1891 to 191. The most important addition

to the list of towns is that of Lyallpur, the capital of the

Chenab Colony which was constituted a Municipality in 1899 and has now a population of 9,171 souls. Founded in 1896 and named after Sir James Lyall, Lieutenant-Governor of the Punjab from 1887 to 1892, it was planned, like Madrid, with its streets radiating from a central square and thus differs widely from the ordinary Indian town. Parachinar as the head quarters of the administration in the Kurram Valley has been also included, and the remaining eleven have been added as coming generally within the Census definition of a town. Khanpur was in 1891 included in the Municipality of Hoshiarpur but was declared a separate Notified Area in 1892-93.

14. Classification of Towns by size .- Following the Census classification

		H	RITISH TER	RITORY		
					Number.	Population,
		Punjab				
Cities	***	***	**	***	3	573,968
Large	towns	***	***	***	17	738 133
Small !		***	***	***	151	1,013,366
	North-W	est Frontie	r Province.		-	
Large 1	towns	***	***	***	3	157,646
Small :		***	-97	***	17	112,250

towns may be conveniently divided into three main classes :-

(i) cities of over 1,00,000 inhabitants, (ii) large towns of from 100,000 to 20,000 and (iii) small towns of less than 20,000 inhabitants. The numbers of the urban population in each class are given in the margin.

15. Distribution of the urban population in British Territory.-Ac-

				-	
_			1901.	1891.	1881.
			221	21	10.2
	***		34.5	34'9	28 4
	***			20'	13 2
	***		16.3	14'9	15'2
	***	***	43 4	44'I	52 I
				69	5.6
	***	[8.2
	***		22'4		23 7
	***		7.3	6.8	14'3
				345 183 183 434 61	

cording to the Census of 1901 the total urban population amounts to 2,595,372 in these Provinces and its present distribution as compared with 1891 and 1881 is shown by the figures in the margin. It will be seen that the cities alone contain over one-fifth and the large towns over one-third of the whole urban population.

16. The Cities and Towns as centres of trade,-The movements of troops affect the figures of cantonments, and to a great extent of civil lines, and they will therefore be left, as far as possible, out of consideration in discussing the progress or decay of the towns which depend on trade. The fluctuations in the populations of the towns, including the cantonments, will therefore not be discussed and only the Subsidiary Tables 11, B. and C.

figures given below, which are those for the municipalities, will be commented on and explained.

17. The Cities .- The combined population of the three cities of Lahore, Delhi and Amritsar has risen from 506,199 in 1891 to 573,968, an increase of 67,769 persons or 13'4 per cent., so that over one-third of the increase in the total urban population is in the cities. But though the city populations have thus increased rapidly it must be borne in mind that in 1881-91 Amritsar decreased by 10 per cent., and, though its increase since 1891 amounts to 18 per cent., the present increase on the figures of 1881 is only 7 per cent. Lahore, on the other hand, would have shown a somewhat larger increase had not the Mian Mir Cantonment decreased by over 1,100 persons.

[•] In a few cases the figures of the Civil Lines have been included in those of the Municipality and cannot be separated. Their inclusion however will not appreciably affect the conclusions to be drawn as the figures are very small.

Delhi.—The commercial development of Delhi during the past decade has been remarkably rapid, but not apparently sound to judge from the Deputy Commissioner's remarks:—

"The decade has been marked by the rapid growth of Mill industries. Indigenous trades and manufactures have suffered proportionately. This growth has however received a check from circumstances connected with the failure of Ralph Douse & Sons, etc., and the discovery of the insecure coudition of other Company concerns. There has been also a rapid growth in the Commission Agency business and, though business is at persent slack, their prosperity is likely to continue. German goods flood the Delhi markets."

The population, excluding 2,041 souls in the cantonment, has risen by nearly 9 per cent. and is now 206,534.

Lahore, the capital of the Punjab, excluding Mian Mir Cantonment, has risen by 18 per cent. and has now 186,884 inhabitants. There has been a large increase in the number of cotton-ginning factories in the last five or six years.

Amritsar.—Amritsar with a present population of 161,039, excluding the cantonment, has increased 18 per cent in the decade. The Deputy Commissioner remarks that 'the increase is due to the development of carpet and other factories, and the existence of a trade-market for food-grains and other articles of mercantile value and daily use.'

18. The large towns of the Punjab (in British Territory).—The figures show that all the large towns in British Territory have increased in population since since 1881, but that since 1891 Ambala, Ferozepore, Rewari, Panjat

tion since since 1881, but that since 1891 Ambala, Ferozepore, Rewari, Panipat and Dera Ghazi Khan have decreased. The towns which show most advance since 1891 are Rawalpindi, Multan, and Sialkot.

Subsidiary Table II-B.

Taking the large towns in order of population :--

- (1) Multan shows an increase of 16 per cent. It is the most important town in the south of the Province and favoured by its position on the Karachi route.
- (a) The town of Jullundur shows an increased population of 8 per cent, having now 54.455 inhabitants, but according to the District report it should have developed more rapidly. Its general trade is good and a combined cotton, oil and flour mill, in which iron will also be worked, has been erected. Its grain-trade has however fallen off owing to the establishment of a large grain-market at Phagwara, in Kapurthala, where octroi is not levied, and that in piece-goods has declined because no octroi is levied on them in Amritsar, whereby the trade has been diverted to that city. Country sugar is said to have been displaced by English.
- (3) Ludhiana shows an increased population of 48,211 or 2,187 more than in 1891, an increase of 5 per cent. It has increased by over 4,000 inhabitants since 1881. What the effect on its trade of the Ludhiana-Dhuri-lakhal line will be cannot yet be foreseen.
- (4) Rawalpindi has increased by 31 per cent. and has now a population of 47,077. It has no special manufactures but a large general trade.
- (5) The development of Sialkot is somewhat remarkable. It has now a population of 45,374 as against 39,612 in 1891, an increase of 15 per cent.
- (6) Bhiwani (35,917), in spite of the famines in its neighbourhood, has maintained its position.
- (7) Gujranwala has also increased rapidly. In 1881 it had a population of 22,107, in 1891 of 25,892 and it has now 28,356 inhabitants. The Deputy Commissioner writes:—
 - "In the town of Gujranwala there is one flour, oil and rice-busking mill and two cotton ginning factories with flour and rice-busking mills. The graintrade in the town of Gujranwala has suffered considerably since the establishment of trade-marts at Sanglo Hill, Marh Balochan and Lyallpur and the opening of the Wairiabad-Lyallpur Railway."

(8) Batala has been made a great centre of the trade in grain by the railway and its real population is probably more than 27,365, owing

to extensions beyond municipal limits.

(9) The decrease in Rewari (from 27,934 to 27,295 or 639 persons) is not easy to explain. Its situation at the junction of three important routes appears, however, to have ruined its trade. It is noted in the Gurgaon report that a ginning-factory established in the town did not pay and was removed to Hansi, which is also on the line of rail.

(10) Panipat has suffered equally with Rewari, its population having fallen from 27,547 to 26,914, but it still has a population of 1,892 more than in 1881. In 1891 the figures were swollen by the inclusion of some of the staff employed on the construction of the Delhi-Kalka line, and the Deputy Commissioner adds:—

"The decrease in Panipat town is nominal; the population returned for 1891 is that living within the municipal area, whereas in 1801 certain outlying hamlets with 2,162 souls, which were outside these limits, were included in the Cenaus figures of Panipat town. If this correction be made the population of Panipat is larger by 1,548 souls than in 1891."

(11) Ambala (26,744) appears to have been affected by the decay which

has overtaken the population of that District and shows a slight

decrease of 112 souls.

(12) Ferozepore now returns 23,475 inhabitants or 1,862 less than in 1891, a falling off of 7.3 per cent. The Deputy Commissioner writes:—

"It is not certain that 'suburbs' have been estimated in the same way as in 1891. But it is quite clear that Ferozepore City is not progressing. The mortality from fever last year was exceedingly heavy. Besides the trade of Ferozepore has suffered very considerably during the past decade owing to the produce of the villages both far and near, which used formerly to be brought to the city, being drawn away by the opening of petty agencies of European and Native firms at most of the stations on the Railway line."

- (13) Jhang-with-Maghiana and (14) Karnal, as head-quarters of Districts show an increase, but as regards the latter the Deputy Commissioner notes :-
 - "Karnal town used to export a large number of boots and shoes, but the trade has declined as the makers cannot compete with Cawnpore. One cause of this unsatisfactory state of things is that the skilled hands keep their secrets to themselves and another is that smooth machine-made articles are coming into fashion."
- (15) Kasur has attracted some of the trade of Ferozepur, owing to its situation on the Karachi route, and its population has risen by 8 per cent., being now 22,022.
- (16) Dera Ghazi Khan Municipality* shows a decrease of 2,202 or 9'2 per cent., due to the reluctance of capitalists to invest money in the town while its fate is still uncertain. Whether the Indus carries it away or not its decay is inevitable when the cantonment there is abolished.
- (17) Rohtak has now risen to the position of a large town having increased from 16,702 in 1891 to 20,323 in 1901 (if the civil lines be included.) Its rise is directly attributable to the construction of the Southern Punjab Railway and the consequent establishment of a grainmarket in the town.

19. The large towns in Native States .- In Native States Territory all the

	_			Population, 1901.	Decrease.

Narnaul Maier Kotla	***	***	***	19,489	1,670 633

large towns show a decrease since 1891, and Patiala-the only town with over 50,000 inhabitants in a Native State —has now fewer inhabitants than in 1881. The minority of the present ruling chief probably explains this de-

crease, but it is not apparent why Narnaul, in the same State, should have fallen off.

Inicuding the suburbs (with a population of 681), which appear to be outside the municipal limits, the population is now 21,607.

20. The small towns in the Punjab.—Taking these in order by natural
Divisions, Districts and States, 1 propose
to examine the figures in some detail as

the tendency of the small towns to decay is in many instances apparent from the present returns.

INDO-GANGETIC PLAIN WEST.

Hissar.—In the Hissar District, Hansi and Hissar itself show substantial increases, but Sirsa has decreased from 16,415 to 15,800, or nearly 4 per cent, and all the four remaining petty towns show more or less marked decreases. The opening of the Southern Punjab Railway has diverted traffic from Fatehabad to Tohana, which may in time become an important centre of trade.

Loharu.—Similarly the small town of Loharu, the capital of the State of that name, shows a decrease of over 10 per cent., having now only a population of 2,175.

Rohtak.—The capital of the District has increased from 16,702 in 1891 to 20,323 in 1901, or by nearly 22 per cent. Its position on the Southern Punjab Railway has contributed to this. Jhaijar (12,227) remains almost stationary, with a nominal increase of 346. Gohana has decreased from 7,690 to 6,567 or over 14 per cent. Of the remaining petty towns three—Kalanaur, Kharkhauda and Maham—show small increases and five have decreased. In the case of Bahadargarh the railway is assigned as the cause, as it takes the former traffic of the town straight through to Delhi. The population of Beri has probably been affected by the decline of trade, though perhaps it has not gone further afield than Rohtak.

 ${\it Dujana.--}$ Dujana has also a lessened population, having decreased by 193 to 5,545 souls.

Gurgaon.—In the Gurgaon District only one town (besides Rewari) shows a decrease, Hodal having decreased by 1,459 to 8,142 souls, or by over 15 per cent. The increases are, as a rule, small, but Palwal has risen from 11,227 to 12,830, or 14 per cent. This town has now a prosperous ginning-factory.

Pataudi.-Pataudi also shows a small increase.

Delhi.—In Delhi, Sonepat (12,900), and Ballabgarh (4,506), show nominal increases, while the town of Faridabad has fallen from 5,929 to 5,310, a decrease of 619 souls.

Karnal.—In Karnal only one of the five small outlying towns, Pundri, which has a considerable trade, shows an increase, all the rest having decreased, Thanesar and Kaithal in a marked degree. The sacred town of Thanesar has been going down for the last 40 or 50 years. Its climate in normal years is bad, and its Brahmans, who profit by the offerings of the pilgrims to its shrines, have become demoralised by indolence and profligacy. Another reason given by the Tahsildar of Thanesar is that, owing to the advent of the Railway and of scarcity, the artisans have left their homes and occupations. Pehowa, which is not classed as a town, is similarly circumstanced, and its population has gone down even more rapidly. Kaithal is said to have lost 3,000 people in the fever and cholera epidemics of 1900. A cause adduced for the decrease in Shahabad is that the manufacturers of netted paper for tasias, of sitars, and seals have almost disappeared. Panipat was noted for its brass utensils, but there are now few exports.

Jullundur.—In Jullundur there are small increases in six and decreases in three towns. The chief decrease is in Rahon, which has fallen from 10,667 in 1891 to 8,651, or by nearly 19 per cent. The plague has ruined its already declining trade in country cloth and braid. The same cause doubtless accounts for the decreases in Jandiala and Banga.

Kapurthala.—In Kapurthala the capital shows an increase of 10 per cent., while Phagwara shows a still larger increase, having attracted trade from Jullundur, as already noted. The remaining four towns are stationary.

Ludhiana.—The four Ludhiana towns all show an increase except Khanna (3,838), which has a nominal decrease of 39. But the increases are not large, as the figures show, though it is satisfactory that the unhealthy town of Machhiwara should show an increase of 248.

Ferozepur.-In Ferozepur the two smallest towns show decreased populations, and two of the intermediate towns are stationary, but Muktsar has risen by 21 per cent. and Fazilka by 12 per cent. Muktsar is the head-quarters of a Tahsil, the expansion of which has been checked by the recent scarcity, but in which development is certain. Fazilka would have shown a still larger increase, but it has recently lost much of its trade by the opening of the Southern Puniab Railway, and the establishment of a large grain market (free of octroi) at Abohar, which has also diverted its trade, most of which now goes to Karachi viá Kot Kapura.

Faridkot .- Both the towns in Faridkot have increased, the capital by 25 per cent. and Kot Kapura by 23 per cent-the latter at the expense of Fazilka.

The Phulkian States,-In Patiala eight out of the 13 small towns show decreased populations, and four a slight increase. Govindgarh, in the Tahsil of Barnala, has risen from 8,536 to 13,185, or by 54 per cent. The increase is due to its position on the Railway, and to the establishment of a market.

In Nabha three of the four towns show an increase, large in the capital and in Bawal. In Jind four out of seven towns show a decrease, two moderate increases, and the new capital, Sangrur, a very large increase.

Lahore.-In Lahore, Chunian has now a population of 8,959, or 1,380 less than in 1891, which is curious considering that some development of the cotton-ginning industry has occurred there, as in Kasur and Lahore. The decrease in Sharakpur is undoubtedly a consequence of the falling off of the population in that Tahsil. The three remaining towns show an increase,

Amritsar .- Of the four small towns in Amritsar only one, Tarn Taran. The other three are stationary or retrogressing.

Gujranwala.- In the Gujranwala District, all the towns, except Killa Didar Singh, the smallest, show an increase since 1891. Wazirabad, as an important Railway Junction, has risen from 15,786 to 18,069 or 14 per cent. Hafizabad has become a thriving town since the opening of the Chenab Canal and the Railway from Wazirabad to Khanewal. Sodhra on the Jammu Extension has also risen to be a town of some importance.

Kangra.-Kangra, the old capital of the District, has now a population of HIMALAYAN AREA 4,746, a decrease of 488 since 1891. Nurpur continues to decrease. Its population is now only 4,462 or 1,282 less than in 1881. Once a centre of the shawl manufacture, which was carried on by Kashmiri refugees, it has never recovered since the Franco-German war ruined that trade.

Hill States .- The capital of Nahan shows a nominal increase, but the chief towns in Nalagarh, Bilaspur and Bashahr have all decreased. The capital of Mandi has increased from 6,889 to 8,144 or by 18 per cent. and Nagar-Bhojpur the capital of Suket has risen from 1,583 to 2,179, an increase of 38 per cent., while the capital of Chamba has risen slightly from 5,905, to 6,000.

Ambala.—In Ambala, Jagadhri Municipality returns 13,462 inhabitants, an Sub-increase of 433 since 1891, but the town lies four miles from the Railway and ABBA. there is a tendency to extension towards the station, beyond the municipal limits. Rupar also shows a small increase, but the two other small towns, Sadhaura and Buria, have decreased. This is attributed to the unhealthy seasons of 1892 and 1900, but the municipal authorities of Sadhaura seem to be in some doubt as to the exact boundaries of the town. Buria, however, has certainly decreased in commercial activity. It lies close to Jagadhri, which is absorbing its trade.

Kalsia.—In the Kalsia State, both the petty towns of Chhachrauli (5,520) and Basi (4,641) have fallen off slightly.

Hoshiarpur.-In the District of Hoshiarpur, every town with the one exception of Una shows a decrease. The town of Hoshiarpur itself shows an apparently large decrease (from 21,099 to 17,037), but in 1891 it included Khanpur, which has 3,183 inhabitants according to the present returns. Thus the two combined still show a population decreased by over 4 per cent. Tanda-Urmur has also decreased from 11,632 to 10,247 or by nearly 12 per cent., and Hariana has lost over one-sixth of its former population.

Gurdaspur.—In Gurdaspur, Pathankot is the only town which shows any signs of development since 1891. It is the terminus of the Amritsar-Pathankot branch line. Sujanpur and Dera Nanak have declined owing to the extinction of the Kashmir shawl industry, but the former has a flourishing sugar factory, worked by water power. Kalanaur, spoken of as 'almost deserted' in the District report, shows a merely nominal decrease. The railway has injured its trade.

Sialkot.—In Sialkot all the towns show marked decreases except Daska, which has increased by over 116 per cent. The other towns appear to have contributed to the migration to the Chenab Colony, but Killa Sobha Singh has a heavy decrease of over 26 per cent., its population having fallen to 3,338.

Gujrat.—In Gujrat, the head-quarters town of the District has risen from 17,671 to 19,048 or by nearly 8 per cent., Kunja also shows an increase of 17 per cent. but Jalalpur and Dinga have decreased. These three towns are dependent on the agriculture of the District and there are no special causes for their fluctuations. Jalalpur has never recovered the loss of its woollen industry since 1870.

Jhelum.—In Jhelum, the head-quarters of the District show an increase of close on 2,000 inhabitants, or 20 per cent. Regarding Pind Dadan Khan, which has fallen from 15,055 to 13,770 or by over 8 per cent., Mr. W. S. Talbot, the Settlement Collector, writes:—

"Pind Dadan Khan is well known to be in a decadent condition: in this town indeed I looked for a larger loss of population than has actually occurred. The causes are threefold; first, is the loss of the through trade of the salt from the Khewrah Mines hard by, which formerly all passed through Pind Dadan Khan on its way to Miani, or down country by the river route, and now passes out by railway direct without affecting the town; in the second place, grain markets have been established at the stations of Lilla to the west, and Haranpur to the east, and as they have no octroi does to pay, they compete at a great advantage with the older centre; thirdly, the ravages of "hallar-shor" have put out of cultivation a large area of land in the neighbourhood of the town, though it may be hoped that by canal improvements some of the ground thus lost may be eventually recovered."

Chakwal and Bhaun show normal increases.

Rawalpindi.—In Rawalpindi, Hazro has increased by over a fourth, but Pindigheb is stationary, and Attock has decreased. The Settlement Collector of Hazara remarks:—

"Attock town has now no means of support, but the fort and the head-quarters of the Sub-divisional Officer, and is bound to decrease yet further. Hazro, on the other hand, being situated in the centre of the Chach Valley shares in the general prosperity and natural increase resulting from peace and security."

Hazara.—In Hazara, only Abbottabad, the head-quarters of the District, and Haripur have increased. Baffa shows a small decrease and Nawashahr a

NORTH-WEST DRY

Montgomery.—In Montgomery, the head-quarters of the District has increased in population, owing to the location of a Central Jail there, but Kamalia and Pak Pattan have decreased, the former by over 6 per cent.

Shahpur.—In the Shahpur District, Sahiwal, off the line of rail, is the only town with a decreased population, in spite of a thriving trade in toys and decorative work. The head-quarters town of the District shows but a small increase, which is natural, as it may be soon moved elsewhere. Bhera and Khushab have increased rapidly. Both are on the Sind-Sagar Line, as is Miani, which is however stationary. Khushab has a considerable export trade in grain to Europe.

Mianwali.—Of the five towns in Mianwali, four show small increases and one, Kalabagh, a marked decrease of 13 per cent. It is remarked that the Railway has only replaced the Indus as a trade-route and that the towns on it such as Bhakkar and Leiah have not materially progressed.

Jhang.—In Jhang, Chiniot has risen from 13,476 to 15,685, an increase of over 16 per cent.

Multan.—Of the five small towns in Multan, two are stationary and two have decreased in population, while the fifth, Jalalpur, has increased from 3,884 to 5,149.

Bahawalpur .-- Of the eight small towns in this State, only one-Bahawalpur itself-shows a decrease, due to the transfer of the Nawab's residence to Ahmadpur. The increases are, as a rule, substantial and are a result of the general development of the State.

Muzaffargarh -In Muzaffargarh, three of the four towns show an increase. The increase in Muzaffargarh itself is substantial, being 22 per cent., and in the other two, nominal. The fourth and smallest, Khairpur, has decreased,

Dera Ghazi Khan.-Two of the four small towns in Dera Ghazi Khan show a slight increase. The smallest, Mithankot, has decreased, as has also Rajanpur, doubtless because the cantonment there has been abandoned.

- 21. The towns in the North-West Frontier Province.- In Peshawar, the Peshawar Municipality (including the Civil Lines) shows an increase of 16 per cent., having now a population of 73,343 or 10,264 more than in 1891. The other three towns, Prang, Charsadda and Tangi return greatly decreased populations. In the Districts of Kohat, Bannu and Dera Ismail Khan, all the head-quarter municipalities show remarkable increases, and Lakki in Bannu has also increased, but Kulachi, in Dera Ismail Khan, shows a small decrease, and the Settlement Collector writes that 'its importance as a mart for trans-Frontier trade has been transferred to Dera. The considerable trade carried on by the Mian Khels, Gandapurs and other Pathan tribes settled in the Kulachi Tahsil has been greatly injured by the Amir's Custom contractors' exactions'.
- 22. The causes of decay in the small towns.-Thus, out of the 201 trading towns of less than 20,000 inhabitants in the two Provinces, no less than 92, or nearly half, show a decreased population. But the proportion of decaying towns is not the same throughout the Provinces. In the Districts of the Indo-Gangetic Plain, 44 out of 101 small towns show an actual decrease and few of the remaining 57 exhibit much vitality. In the Himalayan Area, 5 out of 9 and in the Sub-Himalayan, 29 out of 44, or more than two-thirds, have decreased and the same remark applies. In the North-West Dry Area, only 14 out of 47 show decreased populations, but the decrease is as a rule very marked.

The causes do not appear to be far to seek. The small country towns, which have been left on one side by the railways, have no well-established manufactures and their through-trade is at once diverted to places more conveniently situated. The administration also tends to centralisation and the legal business of the country is carried on at the head-quarters of the District, so that those towns almost invariably show marked increases. Trade, however, is the great factor. The old hand-industries have been fatally affected by the introduction of steam-power, and, as they die out, the towns which formed marts for the exchange of local manufactures must succumb unless they can support more highly organised factories. These remarks apply equally to the Native States, whose capitals generally show a greater increase of population than the State as a whole, while their smaller towns, unless on the line of rail, are decaying. It is, however, possible that the figures slightly exaggerate the falling off in some cases, or do not bring out the full increase in others. As a rule, the railways have not been aligned close to the towns and there is a natural tendency for them to expand towards the line of rail beyond existing municipal limits and thus part of their population is, under the Census definition of 'town', classed as rural. Again, our octroi system, when it does not actually drive trade away, as at Jullundur, encourages the erection of warehouses and shops outside municipal limits, as at Hoshiarpur. Nevertheless, the decrease in the population of the small towns is a real one and significant of the economic changes which are slowly being brought about under British rule.

23. The sexes in towns. - The male population in the towns greatly

23.	4 440	5011-0					exceeds the female, as figures

Columns	to and	13 of Table I	, page ii,	and 12 and	15 of 1, p	age ii.	be found that in most of the

large towns also the proportion of females is far below the average of the two Provinces. This will at once explain why the birth-rate in the urban areas is, as a rule, below the Provincial rate, and it must also be borne in mind that 'the vice of great cities' renders many of the women infertile. Moreover, the fact that the urban, and more especially the city, populations are composed of immigrants, raises the mean age of the inhabitants, and this again explains why the towns should have a higher death-rate than the rural areas. We cannot then, in the absence of separate vital statistics for the town-bred population, say definitely whether the towns are unhealthier than the rural areas or attempt to account for the slow increase of the urban population in the small towns by an examination of their birth and death returns.

24. The definition of 'village' in British Territory.—The legal definition of a 'village' in the Punjab Land Revenue Act of 1887, and Rule 193 thereunder.

Section 3 of the Punjab Land Revenue Act was adopted, the unit of 1891 being thus retained. Hence the village

of our Tables is, as before, a fiscal unit and not necessarily a village in the ordinary sense of the term.

25. The number of villages in British Territory.—The total number of

	Numb	er of villages.		
Chenab Col	ony	***	***	1,296 106
Kurram	***	***	***	106
Shiranni co	untry	***	***	92
		Tota1	***	1,494

villages has risen in British Territory from 34.664, in 1891 to 36.011, an increase of 1,367, but the Chenab Colony and newly acquired tracts in the Frontier have added 1,494 villages to the numbers returned in 1891, which have thus, in the rest of the two Provinces been reduced by 127 since

that year. The greatest decrease is in Montgomery which returned 1,864 estates in 1891 and has now only 1,311. In 1891, as in 1901, no fixed system could be followed in this District and the number

The villages are mere encampments (rahnas), or hamlets (jhoks), the more or less temporary abodes of the nomad pastoral tribes.

26. The 'village' unit and the number of villages in Native States.—

26. The 'village' unit and the number of villages in Native States.— In the Native States the figures do not show much variation except in the

io not show much variation except in the case of the Hill States. Patiala only returns 3,580 villages as against 3,549 in 1891, while Bahawalpur again returns 960 in spite of the extension of canal irrigation in that State. Of the Hill States those noted in the margin show the chief differences: but in all cases there has been a decrease, and in several the number of villages shown only amounts to a tenth of the number returned in 1891.

In the Himalayas the cultivation is necessarily scattered, and this prevents the formation of large villages, compelling the people to live in isolated homesteads or small hamlets near their fields. The hamlet, however, is not the administrative unit but forms a part of a group of hamlets which has some resemblance to the village community in the plains. This group is known by various names. Thus, in Kangra proper, it is called tappa, hakimi or magdai and is divided into tikas: in Kulu it is known as kothi and is divided into phatis: in Mandi and Suket the hamlet (bás) forms part of the garh: in Bashahr the small villages (gaon) and homesteads form a ghori, or, in Bharauli and in Mori, a bhoj,* and in Kot Khai a sarganna.

The constitution of the group of hamlets varies in different parts of the hills. Thus, in Kangra, it is a mere congeries of hamlets (gaon) and homesteads (lark or bása), roughly divided by natural features into tikas, and the only bond which held the tappa together was the fact that its revenue was collected by a single (a) 15 16-20 of the Kangra Settlement Report, official (a). In Kulu the kothi was the place where a certain number of hamlets had to pay their revenue; then the term was extended to the area of these hamlets.

Boja = A holt (? Skr: varksha) according to Whalley, "Place-names in the North-Western Provinces," (page 13). It is found in village-names in the North-Western Provinces.

In Mandi and Suket the garh, meaning literally 'fort,' is practically the same as the Kulu kothi. There is no joint responsibility for the revenue, because the land is the property of the State in all cases and its occupants are crown-tenants, paying a fixed rent. Each family had its own bit of land, but had nothing to do with its neighbour, and this is the origin of the graon or hamlet.* Elsewhere the group of hamlets is held together by stronger ties. Thus, in Bashahr, the rights of cutting wood and grass in the waste are held jointly by the ghori and fines imposed on the Tahsil are levied by realising a fixed sum from each ghori.

There is a still larger unit called the parganna. This, in Kanawar, comprises a group of phoris, usually three in number, and is administered by a dashaungi. The ghori again is under a char and the hamlet under a headman who bears the modern title of lambardar. In the Rampur Tahsil of Bashahr the larger parganna are each under a palara. In other parts of the Simla Hills also the parganna appears to be a well-defined and very ancient unit. It was often administered in former times, under the Raja, by a kardar, or to use the older word, mahta, a term which may mean 'measurer' or 'appraiser.' The parganna is often held by a tribe of Kanets, the cultivating caste, and is sometimes called by the name of the tribe which holds it.† The mahta appears to have once been hereditary or at least chosen by the Raja from the members of certain families, often Kanet and not necessarily Brahman.

But this larger unit in no way corresponds to the "village" unit in British Territory, either in the Hill Districts or in those of the plains.

The smaller group of hamlets however closely resembles the old fiscal unit of Kangra, which has generally become the "village" of our modern revenue system, and the revenue estate of the hilly tracts in the Districts of the Sub-Himalayan Area and the Salt Range. This group having now been taken as the "village" unit in the Hill States there is practical uniformity in the meaning assigned to the term in the Native States and in British Territory generally and comparison of the returns becomes possible.

27. The size of the village.—The average population of each village in the Native States is 360, whereas in the British Districts it is 552. This is probably due, in the main, to the same causes, whatever they may be, which have caused a greater density of population in British Territory. The contrast is all the more noteworthy in that in the Native States the percentage of the population living in villages is somewhat higher than it is in British Districts.

28. Villages classified according to size.—There are also considerable

Classification of villages.

5,000 and over: 'very large'
2,000-5,000; 'large'
5,00-2 000: 'small'
ander 5,00
Table 11 A column very

differences in the classification of the villages according to size for, defining the terms 'large', and 'small' as in the margin, we find that in Native States only 36 per cent. of the population live in 'very small' villages, less than 50 per cent. in 'small', and

of the population live in 'very small' of the population live in 'very small' vilages, less than 50 per cent. in 'small', and only a nominal percentage in 'very large' villages. In British Territory, generally, the proportion of 'very small' vilages is much less, being only about 27 per cent., while in the Punjab nearly 17 per cent. of the rural population live in 'large' villages (as against 13'5 in Native States) and 2'5 per cent. in 'very large' villages.

And in the North-West Frontier Province insecurity of life and property has carried the tendency towards large villages to an extreme, for we find nearly 5 per cent. of the rural population in 'very large', and close on 26 per cent. in 'large' villages, while only 24 per cent. are in 'very small' villages.

The question whether, under British rule, increased security is tending to the greater dispersion of the village communities into hamlets and isolated homesteads is one which the Census returns do not clearly answer because they only show the fiscal units. The formation of a new revenue-estate would add a

 ¹ am indebted to Mr. A. Anderson, C.I.E., Commissioner and Superintendent of Jullundur, for the above information, and my authority for Bashahr is Mian Durga Singh's Assessment Reports.

[†] As, for example, parganna Rihani in Kuthar.

'village' to our figures, but the foundation of a new hamlet within the limits of an old estate would not. It will however be presently pointed out, in paragraph 32 below, that there is such a tendency in Hazara and elsewhere. On the other hand it is observed in the Jhelum District report that in Tahsits Jhelum and Talagang there is or has been a movement towards the bigger villages (using that term in its ordinary sense presumably) and that, in the latter Tahsil, this movement was due to the out-break of lawlessness in the District. The larger Jhelum 'villages' consist of groups of hamlets, often very numerous, and the movement described appears to be from the out-lying hamlets into the main settlement of the estate, so that its extent cannot be ascertained from our returns.

Villages of (inh.	abitants.)	Percentage Popular 1901.	of Rural tion in 1891.
1-500		26.8	27.8
500-2,000	***	52.7	52.2
2,000 - 5,000	***	177	17'4
5,000 and over		2.8	3.0

Taking the Provinces as a whole there seems to be no such movement. The figures in the margin show that the percentage of the rural population in 'small' and 'very small' villages has only decreased by '5 per cent., and this would be fully explained by the foundation of a large number of small 'villages' in the Chenab Colony.

20. Types of villages.—Just as there are various types of house, and various words to describe them, so there are several types of village and a variety of terms which appear to distinguish them.

Thus in the Montgomery District Mr. W. E. Purser distinguished three Montgomery Zettlement Report, 1878, Section types of villages—the Kamboh, the Jat and the Arain. The first is compact, the

and the Arain. The first is compact, the houses solidly built of mud, with flat roofs, and a small yard in front surrounded by a wall. The Jats of the Bar have straggling villages, sometimes built in a square, with no walled yards but buge cattle enclosures. The houses are usually thatched, and often have wattled walls. The Arain village shares the characteristics of both these types, modified to some extent. In Jullundur the same writer distinguishes two types, the Jat (imitated by the Saini and Mahton), and the Gujar (the Dogar and Rajput villages also following this type). The

Jullundur Settlement Report, Section 18.

former, who have passed completely into the agricultural stage, have compact

villages, each house being separate and consisting of a small yard with rooms or verandahs on two or more sides. In the second or Gujar type, the houses are built less in long rows and more in detached groups, with spacious enclosures for cattle between the lane and the houses. Several houses will have one large court-yard, and disintegration would appear not to have got so far with the Gujars, who still retain pastoral tastes, as with the Jats. The Rajputs' houses are constructed more with a view to securing privacy. As in Montgomery, the Arains follow one or both of these types, a fact which points possibly to a mixed origin of the caste. These notices are less valuable for what they state than for what they suggest. The stage of development at which a tribe has arrived is indicated by the structure of its houses and the plan of its villages. The extent to which the joint families in a tribe have been broken up is undoubtedly reflected by the degree in which their houses have been partitioned, for separate cultivation generally means a separate dwelling sooner or later. Data showing the number of families have not been compiled on this occasion, but enough has been said to show that such statistics would have but a qualified significance unless they had been compiled separately for the main tribes. The number of families in a house clearly varies in each District according to the tribe.

The arrangement of the villages also shows that the peasantry are not universally blind to the necessity for cleanliness. In certain cases, e.g., in Ludhiana, Jat villages have been planned in a systematic way, so as to keep the interior circle of houses in good sanitary condition and the general rule that the Chamars and Chuhras should live apart from the village (as well as from each other) is a useful sanitary custom, but my inpression is that the Hindu tribes enforce it much more rigidly than the Mohammadans, the higher castes of whom are greatly dependent on their menials and so permit them to live more or less in the village.

The number of names for 'village' o: 'hamlet' is vary large and many of them undoubtedly denote different types of village and differences in origin, but I have next to no detailed information on the subject, so it is useless to attempt to discuss it here.

PART III .- HOUSE-ROOM.

30. The definition of 'house.'—As in 1891 the figures are for 'occupied houses' only, no enumeration of those unoccupied on the night of the actual Census having been attempted.* The main object of the Census is a correct enumeration of the people and the obtaining of a correct return of houses had to be subordinated to that object. Moreover in order to secure an exhaustive enumeration of the population it was necessary to ensure that the enumerators should visit every place; at which any person was likely to be found, on the night of the Census, and thus our House-lists gradually became lists of places or sites rather than of houses in the ordinary acceptance of the term, and it may be that the enumerating staff has, in a small percentage of cases, returned occupied places as 'occupied houses.'

31. The number of occupied houses.—The total number of occupied houses in the two Provinces has risen from 3.841.558 in

1891 to 4,326,186 in 1901, an increase of 484,628 or 12'6 per cent., so that the rate of increase exceeds that of the population by two to one.

The returns show small decreases in Gujrat and Hissar. The population of the former District shows a somewhat marked decline, while in Hissar, in spite of a slight increase in the actual numbers of the population, the decrease in the number of houses returned is probably a real one, many houses having been abandoned and allowed to fall into ruins during the periods of famine.

It is noteworthy that in certain Districts there has been a considerable increase in the number of occupied houses returned. Hoshiarpur 14 per cent. Hoshiarpur 5 do. though their population is stationary or decreasing, as

the instances in the margin show.

32. Increase in occupied houses.—There is no reason to doubt that the figures represent a real increase. Thus in Muzaffargarh the number of houses has risen from 69,028 to 76,004 or 10 per cent. due to the formation of scattered homesteads or hamlets in the neighbourhood of the outlying cultivation, and the Settlement Collector of Hazara writes:—

"There has been a large rise in the number of occupied houses over that recorded in the Census of 1891, due no doubt mainly to the increasing tendency of the people to build homesteads on their own lands away from the village site. There are 101,398 occupied houses recorded in this Census as against 81,409 in 1891, an increase of 19,039. As there has been no proportionate increase in the population, the average number of persons per house shows a decrease as compared with 1891, the figures being 5.5 and 6.3 respectively."

This tendency is certainly not confined to Hazara or Muzaffargarh and goes far to explain the general increase in the number of houses, though in some of the more densely intensity of the cultivation prevents the formation of new hamlets or even homesteads outside the limits of the old inhabited site, and the land within this site is in consequence of considerable value, as the bitterness of the litigation about it often shows. Nevertheless the number of houses in the Amritsar villages has increased by 10 per cent., and in the Jullundur villages by 14 per cent.—the rate of increase for the district as a whole.

33. House-room in rural and urban areas in British Territory.—The name of houses has not increased so rapidly in rural as in urban areas, the rate being 13 per cent. in the former as against 15 per cent. in the towns since 1891. It must however be borne in mind that several places have been now classed as towns which were not so classed in 1891, and that the difficulty of accurately defining a house in towns is very great. The urban population appears to be better housed than the rural, there being 5.7 persons to each house in the towns, and 6.4 in villages, but every-day observation would seem to show us that the rural population is incomparably better housed than the urban.

As in 1801 the return of occupied houses made by the enumerating staff was also accepted as correct without revision in the Abstraction Offices.

34. House-room in Natural Divisions, Districts and States,—The number of persons to each occupied house continues to decrease and is now only a fraction over 6, as against 6'5 in 1891 and 6'75 in 1881. The Himalayan Area

climate, as well housed as any peasantry in Europe. In the North-West Dry Area the term 'house' has probably a wider meaning, for, on an average, there are less than 6 persons in each house and in the more backward Districts, such as Jhang and Mianwali, the number hardly exceeds 5. The Chenab Colony returns, 8:6 persons to each house, a comparatively large number, showing that the settlers are not yet all housed, though it will be seen that this number is exceeded in Gurgaon. In the Sub-Himalayan Area the number in each house is slightly greater, while in the Indo-Gangetic Plain house-room seems from the figures to be deficient, but the style of house should be taken into consideration. In the South-East of the Punjab, generally, we find more persons in a house than in any other part of these Provinces, and in Gurgaon there are as many as ten persons per house. The number in Ferozepore, 8, is also high, but in the dry, rain-less tracts of that District, and of the Malwa generally, the houses of the cultivating classes are capacious homesteads and there is ample house-room. The type of house varies considerably in different Districts—and sometimes in different parts of the same District—and thus the differences in the figures for Districts are often misleading, if taken as a criterion of the standard of comfort or wealth of the people.

The variations between the figures for 1891 and those now obtained are slight. Any marked change in the style of living or in the type of house is not likely to occur in a decade, though the tendency amongst the wealthier classes to build bungalows more or less on the European model is noticeable in the towns. Gurgaon now returns 10:1 persons per house as against 9:9 in 1891 and 9:7 in 1881, a curious rise, but in the last decade its population has increased by 11:5 per cent, and has probably out-placed the building resources of the people.

35. Types of Houses.—I have said that the type of house varies in different

35. Types of Houses.—I have said that the type of house varies in different localities and, if space permitted it would be of interest to give a full account of the various types, which, allowing for the differences due to material, depend, in the nain, on the stage of development, as well as on the race or caste of their inhabitants. Thus in the south-east of the Punjab we find, in Mr. Fagant's Hissar Garatteer, 1802, pages 87-88.

Hissar Garetteer, 1892, pages 87-88.

enclosures inside the main enclosure, within which are the chulas or hearths at which the bread is baked, and each distinct confocal group living within one enclosure has a separate chula. In Rajput villages whether Hindu or Mohammadan the houses though of the same type are less neat and, it is curious to note, in many cases contain a far greater number of families in one enclosure than are found in the case of Jats. A degree lower is the Bagar type, the huts of which are however still arranged round the enclosure, though the poorer class of Bágris have merely a circular hut, constructed entirely of interwoven bushes plastered with mud and a thatch. Lowest of all is the Pachhada type—a one-roomed mud

hut standing in a thorn enclosure.

Probably no population in India is better housed than the Jat tribes of Rohtak and Gurgaon, but in the latter district the Meos, who are more backward, live in small villages of ill-built huts. In Karnal the Jat and Rajput houses appear to be the same, but the villages are differently planned, the Rajputs secluding their women. In

Karaal Gazeteer, 1890, page 78.

Ambala the lower castes, Gujars, Chamars, etc., have thatched huts, the Rajputs, Jats and even the Kambohs being better housed. In the Himalayas the greater abundance of stone and timber permits of a better style of building and the houses of the Kangra peasanting the company of the comp

Rangra Gazetteer, pages 58-59.

have generally two storeys, the lower being used, except in the rains, for living in, while the cattle and sheep are stalled in separate buildings. But in Kullu the

There is a plan of a typical well-to-do Jat house in the Delhi Settlement Report, page 109.
 26

houses have generally three storeys, the lowest forming the cattle-shed, the next the granary and the third or highest the living rooms, while in Kullu Saraj the dwellings are carried to four or even five storeys.

There is an excellent description of the Manjha Jat villages and houses in the Amritsar Gazetteer (1892-93, pages 36-37.) and it is pointed out how in that highly irrigated district economy of space is everything, so that overcrowding in the villages appears to be common, and sometimes houses are built at the out-lying wells, though only as a last resource.

In Montgomery the various kinds of dwelling-house illustrate the degress to which the population is nomadic. Thus 'the kotha consists of mud walls and roof, the khudi of mud walls and a thatched roof, the jhugi of matted walls with a thatched roof, while the chhann is entirely of thatch, and the pakhi (lit: a screen) a mere shed of screens. The varieties in Muzaflargarh and Bahawalpur are very similar.

The tendency to replace the old structures of mud and wood by structures of brick is practically confined to the village trader class, though occasionally a Jat, especially if he is a village headman, will re-build pakka. There is however a curious taboo against brick buildings amongst the certain tribes of the submontane tract is Sialkot and Gurdaspur and there is also a customary rule in some Mohammadan villages that no house should be built of brick until the village mosque has been built. The probability is that mud-buildings, being cooler in summer and warmer in winter, are far healthier than those of brick especially when the buildings are small, and are thus better suited to the present capacities of the people. A point of some interest may be noticed here. In most of the old types of house the kothi, chaursia, or bharola the receptacle, often of great capacity, for storing grain was a feature of the dwelling house in all parts of these Provinces, but under modern conditions it seems to be disappearing. Prior to British rule it was customary to keep the grain of many years—in some in-stances, it is said, over half a century—in store, but the facilities of transport and high prices are causing the custom to be abandoned and it is now quite usual for the whole harvest to be sold, barely sufficient grain to last until the next harvest being kept, with the result that a short crop throws the cultivator completely into the hands of the bania. On the other hand the dead-level of prices due to better communications renders it no longer so necessary that grain should be stored for such long periods as before.

36. House-room in cities.—In accordance with a suggestion of the Census Commissioner an attempt has been made to obtain statistics which may illustrate the question whether the cities are over-crowded. This question is likely to become one of pressing importance at no distant date, in view of the spread of plague, and it is to be regretted that plague-measures in Lahore prevented its being thoroughly gone into. In Amritsar the rooms in all the houses were counted and thus the number of persons per room in that city has been accurately ascertained, but in Lahore, and Delhi, a mere estimate of the number of rooms was obtained by counting the rooms in 50 typical houses. This method gives, as a rule, untrustworthy results because the houses are not built in blocks as in European cities, but singly, so that a single-storeyed house may adjoin one with several storeys. Further, as already remarked, the term 'house' is in towns almost incapable of definition. It

Panjab Ceasus Report, 1892, 44.

towns almost incapable of definition. It was found to be so in 1891. And no attempt was made to define 'room' though the indigenous idea of a room is vastly different from ours. To obtain data regarding the extent to which the city populations are over-crowded would require a somewhat elaborate survey of the houses in each ward, of the ground-plan and the size of the rooms, as well as of their numbers, and of the number of storeys.

That the three cities of the Punjab are lamentably over-crowded would, I Subsidiary Table III B. Subsidiary Table II. think, be clear to any one on a very cursory inspection, though the data obtained do not bring this out very strongly. The figures for density certainly do not give any adequate idea of the congestion of the popu-

lation inside the 'cities' because the areas returned are those within the municipal limits, whereas the cities, to use the word in its every-day sense, lie almost exclusively within the old walls, which in former times were as necessary to their protection as they are now an insuperable obstacle to their natural expansion. It is noteworthy that though within the walls the population has greatly increased there would seem to have been no corresponding increase in the inhabited area. The causes are easily seen. The city walls preclude any gradual expansion: beyond them the land is either highly cultivated and valuable, or occupied by public buildings, so that its acquisition is beyond the means of private persons. Fortunately this very density of the population within the old limits has almost always necessitated the construction of factories beyond them and this fact should facilitate the solution of the question of over-crowding in the near future.

But greater obstacles to any schemes of municipal extension will pro-buy be found in the customs of the people themselves than in any of the physical difficulties. The cities, and most of the towns, often contain mohallas or alleys occupied by caste or trade communities. This is however by no means invariably the case, and the tendency appears to be for the members of a trade to disperse more and more throughout a town, as competition becomes keener and prices are less regulated by custom. On the other hand the joint family dwelling is still an obstacle to progress. As long as the family is united it is held in common, but when dissensions arise, as they so frequently do, it is partitioned, either the area being divided or each storey being allotted to the various branches of the family. It rarely occurs that any member foregoes his share or is bought out and one of the results of this clinging to the family dwelling is that the middle classes in towns are probably much less wholesomely housed than the poorer classes who have no parda and are not tied down to an over-crowded quarter. Another result is that there are difficulties in making additions to the building, because in the nature of things there is a limit to the number of storeys which can be superimposed on the old and often insecure foundations so that complete re-building is often necessary and this taxes the whole resources of the joint family to the utmost. Nevertheless the amount of rebuilding done is very considerable, and this is notably the case in Amritsar which would seem to have been half re-built within the last twenty years. The desire to rebuild is perhaps to some extent fostered in towns generally by the Hindu idea that it is lucky to be always repairing or adding to the house, (Ludhiana), but the idea, (in Bahawalpur), that it is unfortunate to extend one's premises anywhere but to the front may possibly prevent re-building in some degree. The houses re-built in recent years are generally far better in style and accommodation than those which they have replaced, but it is unfortunate that in many cases lofty houses have been built when formerly there were structures of only one or two storeys, so that the streets and alleys are less open to light and air than before.

Generally speaking the type of house in the towns does not greatly vary throughout the Punjab, though certain castes, as for example the Bhatias, have large common dwelling-houses, while others rather tend to sub-divide their houses. The custom of caste-mohallas enables the women to sit and work out of doors, and this, and the general habit of sleeping on the roof in the hot weather, probably does much for the health of the urban population, but the latter custom leads to constant competition, it being an object of ambition to secure absolute privacy by raising one's house higher than one's neighbour's. Social superiority is thus measured by the height of the roof and in Lahore six storeys (excluding the ground-floor) have been attained in one or two families. These structures over-shadow the older and poorer tenements in which the basement is often well below the present level of the street.

CHAPTER II.

MOVEMENT OF THE POPULATION.

PART I.

VITAL STATISTICS.

1. The system of registration.—As frequent reference will be made in this as ubsequent Chapters to the figures of the births and deaths recorded during the past decade, it will be best to give here a sketch of the system under which the vital statistics of these Provinces are compiled, and to deal with some of the general questions they involve, fuller discussion of special points being reserved for their proper place.

2. Urban areas.—Under section 143 (1) (c) of the Punjab Municipal Act, XX of 1891, Municipal Committees have power to provide, by bye-laws, for the proper registration of births, marriages and deaths, (and for the taking of a census). Most of the Municipalities in these Provinces have adopted bye-laws under the Act for this purpose, but it is not clear that all of them have done so.

The bye-laws, generally speaking, are enforceable by penalties, but in other "pute Part III. Chasters IV—V of the Panjab respects they are somewhat diverse. Thus maintepal Massal, 184.4 in Delhi the obligation to report a birth or death is imposed on the head of the household, or a grown up member of it, and on the customary sweeper. In Lahore the obligation lies on the head of the household, or any adult member of his family, or adult male servant, or on the midwife employed, or on the mohalla sweeper, but the villages within Municipal limits are exempt from this rule. In Multan the midwife may report a birth and the sweeper a death, if the head of the household, etc., fail to do so.

In the second-class Municipalities, which have adopted the Model Rules, the obligation is laid, firstly, on the head of the household, or an adult member of it; and,

secondly, on the sweeper and Mohalladar, who are jointly and severally responsible that the occurrence is duly notified. Heads of public institutions are also bound by the rules to report. If these rules were enforced, the registration in the Municipal towns would leave little to be desired.

The Sanitary Commissioner, however, considers the registration in Municipalities' very defective,' and, in paragraph 18 of the Report on the Sanitary Administration of the Punjab for 1900, points out that in that year in only 20 out of the 150 Municipal towns were fines imposed for failure to report births or deaths. Only 105 persons were fined, and the amount of the fine averaged about nine annas.

In Cantonments, births and deaths must be reported by the head of the Sections 242-4 of the Cantonment Code, 1899.

Settions 242-4 of the Cantonment Code, 1899.

Births and deaths amongst the native population in cantonments is sent to the Sanitary Commissioner of the Province, but the figures are not included in his

Section XVII, 5 (d), Army Regulations, India, Vol. II.
Foot-mote to Sanitary Administration Report.
Funjab, 1892, Annual Form I.

returns. Further, the data for the European and Eurasian population, whether resident in cantonments or not, are also excluded from the Sanitary Commissioner's returns.

I am not in a position to say whether vital statistics are completely registered or accurately compiled in cantonments. They are not under the control of the Sanitary Commissioner in any way, and all the figures given in this report, which have been taken from the Sanitary Administration Returns, are based on returns which exclude (i) the total population of cantonments, and, (ii) the European and Eurasian population outside cantonments.

The vital statistics of the Director-General of Statistics, (Judicial and Administrative Statistics, 1899-1900, page 25t), appear to be based on the Sanitary Commissioner's returns.

3. Rural Areas.—In rural areas there is no legal obligation imposed upon private persons to notify a birth or death, but the village officials, i.e., the village Rule 22 wader Section 39 A of the Punjab Laws headman and watchman (chaukidar), are det, IV of 1872. Sound by law to report every death to the Police authorities and 'to furnish such other information, in connection with vital statistics as may be required of him from time to time.' Under this rule registers of births and deaths are maintained, for each village, by the village watchman, the village headman being jointly responsible in theory.

4. Agency: the village watchman.—Thus the Registrar of births and deaths in a village is the village watchman, and he is, in practice, held solely responsible for the accuracy of the returns. To gauge their value his position must be clearly understood.

Originally a menial servant of the village community, the village watchman, was pa'd out of the common funds in kind or in cash. This placed him in complete dependence on the headmen as representatives of the village, and this relation was legalized by the rules under the Punjab Laws Act, but the actual appointment or dismissal of the watchman was vested in the Deputy Commissioner. Still, as a matter of fact, the headmen retained in practice, through immemorial usage, much of their former powers, so much so that the first half-year's salary is paid them by the chauktidar as the first fruits of his office.

In 1893 the increasing difficulties of obtaining men for the post led to enquiry. It was found that the maximum pay, Rs. 3 per mensem paid half-yearly, was inadequate, and that even so it was not always paid regularly. Power was 1898. The property of the

per mensem instead of Rs. 3.

These measures will doubtless in time improve the status of the village watchman, but under the old system he was essentially a menial, generally of a low caste, almost always illiterate, and of doubtful character. The lowness of the pay compelled him to work or cultivate land to eke out a living, and his association with criminals was often alleged. This agency was the key-stone of the system under which our vital statistics were collected.

After the Census of 1891, when attention was directed to the importance of accurate vital returns that system was thus summed up:—

"Births and deaths are to be reported by village chaukidars, who are provided with two books, one for births and the other for deaths, in which entries can, on the chaukidars' report, be made by any resident of the village who can read and write, and the headmen of each village are made responsible that these entries are made. The chaukidars will bring their books with them to the tham at their weekly visits, and from these books and from oral enquiries from chaukidars the Police Muharrirs will compile the fuller registers which they are to maintain. The Police Muharrir will sign the chaukidars' books in token of having seen them.

Compilation — The station returns are to be submitted to the District Superintendent of Police, who will forward them to the Civil Surgeon for compilation in his office. The Civil Surgeon should scrutinise the station returns so far as his knowledge enables him to do so, and should note for future enquiry or guidance any peculiarities or shortcomings which he may observe in them. He will then forward weekly, monthly and annual returns, compiled from the weekly, station returns, to the Sanitary Commissioner, from which the provincial weekly, monthly and annual returns are prepared.

The Deputy Sanitary Commissioner and Civil Surgeons when on tour should examine chaukidars' birth and death registers, and should verify the entries by investigation on the spot, and they should record the results of each examination in the Police Station Visitors' Book for the information of the District Superintendent of Police."

District Officers were also asked to take a personal interest in the matter and Tahsildars and Naib-Tahsildars directed to test the registers when on tour.

^{*}Although the gost tends to be becediary, there is no special cave of chesided as in this Powince. The Berralia of these to employed in the sub-monaine Districts of the North-Rast rought, but everywhere men of any caste are employed. The land-owing tribes will rarely accept the peak, which is held by men of the lower arises and mental castle for the most part.

In the Frontier Districts certain tracts have not the ordinary village organisation, and in these special arrangements have been made, while in the Tanawal territory in the Hazara District registration has not yet been attempted.

- 5. The system of compilation.—It will be observed that several authorities are responsible for the compilation of the returns. The village officials are under the control of the Deputy Commissioner, but their returns go to the Police Department, which in turn sends them to the Civil Surgeon, who forwards them to the Sanitary Commissioner. The Municipal returns, however, go direct to the Civil Surgeon. On the other hand, the Cantonment returns do not go to the Civil Surgeon at all, and the returns of births and deaths given in the District reports therefore omit their figures, though only in the case of Rawalpindi is this expressly stated, in the District Census Report, to be the case.
- 6. The value of the vital statistical returns discussed.—Writing in 1802 Mr. Maclagan said:—"As regards the absolute value of the figures, I believe them to be utterly unreliable. On the frontier this is palpably the case, for the birth and death-rates there are, and continue to be, abnormally low. And in the rest of the Province those who have devoted most attention to the subject are the most convinced of the utter inadequacy of the vital returns."

Since 1892, however, much has been done to secure greater accuracy in these returns. The greatest step was the improvement of the supervising agency. In 1882 Dr. Bellew had utilised the services of Vaccinators and Superintendents of Vaccination in checking the vital statistical registers. In 1894 a Divisional Inspector of Vaccination was appointed in each of the Divisions of Jullundur, Delhi, Rawalpindi, Derajat and Peshawar. In the Lahore Division, however, the appointment of any such officials was opposed, and hitherto there have only been Inspectors in five of the six divisions of the Province.

That these measures have improved the accuracy of the data is certain, though it would be idle to assert their absolute reliability.

The Sanitary Commissioner notes that 176 chaukidars were fined Rs. 130, or less than a rupee each, in 1500. Assuming that on an average there is one chaukidar to each village, there are upwards of 35,000 of these officials in the Punjab and North-West Frontier Province, so that only one in every 200 was convicted of neglect or omission to report in that year.

The inspecting agency, however, detected numerous omissions. Out of 55,656 entries of births, 9,614 omissions were detected. This I understand to mean that in inspecting the entries and enquiring into their accuracy it came to light that 9,614 births had been omitted. This gives a percentage of nearly 12 omissions to births recorded.

Similarly in inspecting 399,798 entries of deaths, 6,701 omissions (or 1.6 per cent of the number recorded) were detected.

7. Conclusions as to the relative value of the data.—The probabilities appear to be that in rural areas the returns are comparatively trustworthy. Ignorant as the chaukidar agency may be, it is completely under control, and the fear of inspection probably does as much as actual inspection to secure fairly accurate registration. The village watchman moreover is almost invariably a native of the village and has a small, well-defined area to deal with,—both points in favour of complete registration. In the Frontier Districts, however, the vital statistics are admittedly still very defective, and it is doubtful whether any reliance should be placed on them.

That the registration in towns is as complete is clearly open to the greatest doubt. The enforcement of the rules is beset with practical difficulties. There is no one responsible official and apparently no system of inspection or supervision. It does not seem to be the duty of any one in particular to put the law in motion, even if a breach of it be detected.

It is exceedingly difficult to say whether the completeness or accuracy of our returns was affected by the dislocation of the administrative agencies in the

An additional Inspector was appointed, temporarily, in the Jullandar Division in 1895.

famines. I think the presumption is that they were not affected one way or the other. In the first place no famine in the Punjab reached the stage at which the village headmen and watchmen abandon their villages, and any tendency to laxity would be counterbalanced by the extra supervision necessitated in times of scarcity. 'In relief camps it (registration) is,' the Sanitary Commissioner considers, 'certainly more accurate. Elsewhere the tendency of the people to wander in search of food is certainly against complete registration.'

Nevertheless it is impossible to set aside the vital statistics as altogether worthless. In the nature of things greater accuracy can be claimed for the census returns, but they can be usefully compared with the data for births and deaths available. Comparison of these data with the census returns cannot indeed be expected to give absolutely precise results. The population of 1901, in any given District, only partially consisted of persons born in it. Migration plays a great part in the movement of the population, and this applies especially to the Punjab in the past decade. The comparison should be made with the figures of the whole population born in each District or Province, wherever enumerated, and not only with those of the population enumerated in that District or Province. But we are still very far from being able to make any such comparison.

It will be clear that to obtain complete figures of the whole population born in a given District a synchronous census of the whole world would be required. If in such a census we could obtain accurate returns of the District of birth—which would be in practice impossible—it would be easy to 'put back' all those born in a given District, and thus obtain statistics of the exact number born in it. Our returns however do not even show those born in each Punjab District or State but enumerated in another Province of India, so that we do not know how many people from Ferozepur, for instance, have been enumerated in India, but beyond these Provinces, though, as will be seen later, we all but obtained these data on the present occasion.

8. District-born population defined.—As the expression 'District-born' appears to be new in Punjab Census Reports it must be defined. The meaning which it bears in Subsidiary Table IV-A. is "born and enumerated" in the District of enumeration, and the figures given for any particular District do not include those born in that District but enumerated outside its limits. The natural meaning of the term would be 'born in the District' wherever enumerated, but it will be apparent from the preceding paragraph that the term must be used in a restricted sense.

9. Comparison of the actual and estimated population.—It has been pointed out (in paragraph 2 above) that vital statistical returns for the population as a whole are not compiled, and in consequence it has been necessary to

limit the comparison of the numbers, as ascertained in the census, and those estimated from the recorded births and deaths of the 1891-1900 decade to the population under registration.

Taking first the vital statistical returns we find that the actual population of 1901, in British Territory, exceeds that estimated from the vital statistics by 148,653. Allowing 45,000 for increased immigration from within India we are still over 100,000 out. Taking, however, only the Punjab Districts, in which registration is incontestably more complete than it is in the Frontier Districts, we find that the census returns a population of 22,209 less than the vital statistical estimate. This appears a satisfactory result. At first sight it seems as if the census returns should have exceeded the estimate, because births are more liable to escape registration than deaths, but 1 think increased emigration to beyond India fully accounts for the difference which is really wonderfully small in a population of over twenty million souls. When we come to examine the figures for particular Districts we find differences, small for the most part when the numbers are considered, which can only be explained by taking into considerations. The visual statement of the figures for migration. Indeed columns 3 and 4.

of the abnormal migration to the Chenab Colony I have 'put back' the immig-

rants to the Colony in the Districts whence they came, because a real comparison of their present figures with those of 1891 can only be made by so doing. If we could also 'put back' all the emigrants enumerated in India we should arrive at a juster estimate of the value of our returns, (though even then we should perforce have to omit emigrants to cuntries beyond India). We cannot however do this, for we have no data by Districts for 1891 and those for 1901 are not altogether complete. This being so it seems best to take, in the case of individual Districts, the District-bern population as a standard of comparison, because that population is probably in the nature of things far less unstable than the total population, into which the more fluctuating elements of imigration enter largely.

II.

The estimated population calculated on the rate of increase must next be noticed. The rate assumed is 9'8 per cent. per annum, i.e., a rate of nearly 10 per cent. increase each year on the fore-going year, which is the same thing in Census of Irdia, 1891. General Tables, Volume principle as compound interest. This rate is obtained from the actuarial calculations of the birth and death rates for 1881-91. The normal rate of increase, it is a relief to find, is only 6 per cent. and an estimate based on that would have given very different results. If the population increased for two or three consecutive decades at the rapid rate of 9'8 per cent, per annum it would out-pace the development of its resources and starve. Nevertheless the estimate based on this high rate only exceeds the actuals by some 570,000 souls. It is clear then that in spite of famines and plague, (which latter had no appreciable effect on the population prior to 1901,) the increase in the population of these Provinces as a whole since 1891 has been normal. The most conspicuous exception is the District of Ambala

10. Still-births.—Under the orders of the Government of India issued in 1898 still-births* should be excluded from both the birth and death returns, but the orders do not seem to have been always understood, for it is naively explained in the Sialkot District report that those born dead are included in the birth, but not in the death-returns. The Sanitary Commissioner of the Punjab has however obtained certain data, appended to this chapter, which are of considerable interest.

The Districts of Ludhiana, Ferozepur and Jullundur all return very low percentages of still-births, in the five years 1896-1900, but Hoshiarpur returns the lowest of all. II, however, it be assumed that still-births in these Districts are conccaled, we should expect to find a correspondingly low birth-rate in them; but this is not apparent, as is shown by the figures below:—

		Birth-rates.				
		1896	1897	1898	1899	1900.
Province	***	43-	42.6	41*	48.4	41'1
Ludhiana		45'3	46.6	42.6	51.8	45'4
Ferozepur	***	50.8	47.8	45.7	56.	42'8
Jullundur		43'1	45'4	42.1	48.5	46.
Hoshiarpur	***	36.3	39.0	39.1	45.4	41.

The first three of these Districts show a birth-rate higher than that of the Province, in the last five years, and Hoshiarpur is hardly below it. It has been ingeniously conjectured that the cause of the small number of still-births reported in Hoshiarpur, is that the people are afraid to report such births lest they should be suspected of female infanticide and a police enquiry held. This is highly probable. The proportion of males to females born dead is as 120: 100 or corsiderably higher than the general ratio of male to female births, but it is not so high as in Europe, and it may thus be inferred that female children born dead are not habitually or frequently reported as male, because if that were the case we should expect to finc a much more disproportionate number of the latter. The figures, if at all accurate, point to the conclusion that still-births are not so common in India as in Western Europe. Muzaffargarh and Dera Ghazi Khan alone approach the ratio in France.

The term 'still-born' is used in varying senses, even in Europe. In India 1 per cent, of the cases at most from the subject of competent medical diagnosis, and it is not to be understood that the term is used with any pretensions to precision, Cf. Newsholme, page 80.

II. The Birth-rate since 1880.—The figures for the birth-rate since 1880,

YEAR.			Birth-rate per 1,000 of population according to the Sanitary returns.	Average birth-cate per quinquennium.

the year in which registration began, are given in the margin with the quinquennial averages. The ratios are calculated on the Census figures of

1868, 1881 and 1891.

The 1881-85 quinquennium had a birth-rate of 39'45 per mille, while that of 1886-1890 had a lower rate-39'01although as the population was really greater in the second than in the first quinquennium an increased rate might have been anticipated.

In the 1891-1900 decade registration was undoubtedly more accurate. In spite of the sudden drop in 1891, obviously due in part to the calculation being made on the increased

population returned in the Census of that year, the rate remained at 39 per mille in 1891-95. In the last quinquennium the rate has averaged 43'2 per mille. This rate is very high when it is considered that the population of these Provinces contains a very low proportion of females.

12. Marriage Seasons .- As Lent is in Europe a close period for marriages, for religious reasons, so among Mohammadans no wedding can take place during the Moharram, or the first ten days of it, when there is mourning for the disastrous days in which the Imam Hussain was killed. The first 13 days of Safar, and the first 12 of Rabi-ul-awwal-periods during which the Prophet was sick-are also times when no marriage may take place. The Ramzan is a similar period, in Peshawar, but in Dera Ghazi Khan it is said that, like the Shaban, it is considered an auspicious period, except by the mullahs.* Bara-wafat is also a period during which no marriage should be celebrated.

Among Hindus the inauspicious times are longer and less readily explained. In Europe, from Roman times, May has been considered an unlucky month for marriages, because apparently it was to some extent a month of purification,† while April, which corresponds roughly to the Hindu Baisakh, was the month at Rome when marriages and other less legal unions were specially frequent. During the first days of June marriages were undesirable-as in May, while incompatibility of temper would result from marrying in March.

The auspici	ous months t	or the	e ceremony of marriage appear to be th
Paisakh. Jeth. Har. Sawan. Bhadon. Asauj.	Katik. Maghar. Poh. Magh. Phagan. Chet.		first three months of the year, in spring and the months of Maghar, Magh an Phagan in autumn. Magh however said to be unlucky in Dera Ismail Khai Moreover Har is not, as a whole, auso

cious, at least in all parts of these Provinces. It commences the period which is held peculiarly unlucky in the East of the Punjab and which is thus described :-

"From Har Sudi 11th, throughout Sawan, Bhadon, Asauj, and up to Katik Sudi 10th is the unlucky time during which the gods sleep, and marriages begin after the Deouthani Ikadshi, (Katak Sudi 11th), when they awake." Yet this

The best day for a wedding is the 27th of Ramzan, as the prophet declared it sacred, and widows are often married on that day. Thursdays and Fridays are good days of the week.

The 3rd, 13th, 23rd, 8th, 18th and 28th of every monthlare unlucky for astrological reasons (Hoshiarpur, Jullundur and Jhelum). In Kurram the 3rd, 13th, 23rd, 7th, 17th, 27th and 21s: are unpropitious.

[†] Warde Fowler, The Roman Festivals, page 100. Cf: also page 293.

² Jeth however is not lucky in the case of a first-born (Sanskrit jestha). This seems however to be only a particular case of a more general rule. The month in which the bride-groom was born is inauspicious (Gujnat). No marriage should take place in jethi de idne bride-groom or bride was born in that month.

^{\$} The egg-plant must not be eaten during this period. (Hissar). Chet in also unlocky ofter the Holi, but the Plag day of the Holi is exceedingly propinties and no astrologer would be consulted in the fixing of it, but this does not apply to the trading classes, (Ambain,

period is not universally held unlucky, for though 'Bhadon, Asauj, Katik are not propitious,' (Karnal), yet in exceptional cases marriages do take place in the Deouthani Ikadshi, but such are called ansochhta shadi.

In the northern Districts however the second three months of the year are peculiarly propitious and 'most marriages take place in Sawan, Bhadon, Asaui, (Gujrat): and 'marriages could also be celebrated in Sawan, Bhadon and Asauj, but this custom is dying out. Katik is unlucky.' (Peshawar.)

The unlucky months are Katik, Poh and Chet, and this belief appears to be fairly widespread: Katik is the month sacred to the worship of Devi, who is represented by young girls, and this may account for the superstition: why Poh, universally unlucky, as far as I can ascertain, should be so, does not appear: Chet is the last month of the year and would seem to be wholly unpropitious as a rule. In Jullundur, Ferozepur, Hoshiarpur, Amritsar, Gurdaspur, Sialkot, Gujrat, Jhelum and Dera Ghazi Khan they are expressly said to be the unlucky months.

Amongst the Kangra Gaddis the first days of certain months have special names and the unlucky months for marriage are: - Chet, the first day of which is called Dholaru, because beggars go about on that day with drums (dhol) to collect alms: Bhadon, or kala mahina, the black month; and Poh, or Parthani.

To these is added Asauj in Kangra, but, in Suket, Poh and Chet, Sawan and Asauj are given as the four unlucky months. Sawan is so unlucky that it gives Kangra Gazetteer, page 71. its name to the Sawani Brahmans, who, like the Dakaut, receive black offerings.

Thus the Hindus have two distinct groups of months during which marriage is likely to be unpropitious, the first the Har-Katik period, the second the three non-successive months of Katik, Poh and Chet. The propitious months are very much the same as those prescribed by orthodox Hinduism,† and are based on astrological considerations.

13. The twelve-year cycle of Brihaspati or Jupiter .- "The names of the (twelve) lunar months Indian Antiquary, Volume XVII, 1838, pages 1-7, and 312-317. are used as the names of the

samvatsaras of the twelve-year cycle of Jupiter, and the names of these months are given to the samvatsaras, in accordance with the particular nakshatra in which Jupiter's heliacal rising takes place." This being so, one might have expected that the samvatsaras corresponding to the unlucky months of the year would be unlucky years for marriages, but this, I understand, is not the case. The inauspicious period in the twelve-year cycle of Jupiter occurs when the planet is in the zodiacal mansion of Leo, and this gives its origin to the name singhast, or singh-gat, applied to that period.\$

The last singhast lasted from about August 20th, 1896 to September, 17th 1897, or nearly 13 months. It was however preceded by an intercalated (or lund) Jeth, and the last 15 days of the first Jeth and the first 15 of the second were inauspicious: then came an unlucky period, due to the invisibility of the planet Venus, (Shukkar), which lasted throughout Har and the first half of Sawan, by which time the singhast had set in. The close of that period was in Asauj of Sambat 1954, and Asauj and Katik being themselves unlucky months the inauspicious period was further prolonged until the end of Katik, 1954. Hence the close period lasted from Jeth 15th, Sambat 1953 to the end of Katik in the following year, or over eighteen months altogether.

^{*} There is an exception however, as noted above, in Ambala, and I find it noted that:— "The last day of Chet is auspicious, except for some of the higher Khatri families, even in a period of Singh-ghat. It appears that the marriage, must, however, then take place at night. (Dera Ismail Khan.)" The higher grades of certain castes seem to have several customs and beliefs diametrically opposed to those of the lower grades.

[†] Cf. Steele's Law and Custom of Hindu Castes, page 27. An instance of marriage being restricted to two months (Har and Sawan) in the case of certain castes (Mang and Mhar), is given at page 164.

[&]quot;When jupiter is in risible, somelduties and ceremonies, such as investine with the sacred thread, marriage, pligrimages, etc., are not to be performed."—Note 12, page 315 of Indian Antiquary, 1888 Jupiter was invisible too some days after the ningh gard and insuspicious just before it, and both period are alluded to in the notes received as inampicious for marriage on this account, irrespective of other obstacles.

I The exact dates are varieatly given. Possibly the differences are due to the different methods of calculating jupilers, eyel which may be done according to his billiand inting, or determined from the particular also of the sodies is which jupiler stands with reference to his mean longitude according to the article already cited. I am quite canable to say which system Is really in use in this part of India.

During the whole period of singh-gat marriages cannot take place, except when the sun is in Mekh, (Aries), and then only according to some reports, provided the sun enter that sign in the month of Baisakh,* This rule is said to be binding on Hindus of all grades, but it is remarked that the Arya Samaj sect do not observe it, and that Jats who sell their daughters have no objection to marrying them during a singh-gat, (Ludhiana). In Gurgaon the prohibition is only observed by Hindus who avoid karewa or widow re-marriage. The spell could, moreover, be broken for all Hindus if a raja married his daughter, or the daughter of a Brahman, with special ceremonies, involving huge largesse to Brahmans, and in which the sacrifice of a gold lion plays a conspicuous part. No such ceremony however took place in the course of the last singh-gat and in consequence betrothal, marriage, muklawa, and thus in many cases the commencement of married life, had to be postponed, just as all other ceremonies which require good auspices for their celebration, such as investiture with the janeo or sacred thread, chhath, or living in a newly built house, karan-bedh, or boring a girl's ears, pilgrimage, coronation and others, had to be deferred. It is thus conceivable that the long singh-gat of 1806-7 had an appreciable effect on the birth-rate, both by postponing married life and, indirectly, by retarding marriages, but it is not possible to estimate its precise results. Probably the lower classes of Hindus did not observe the prohibition at all strictly.

14. The commencement of married life.—While the ceremony of marriage can only take place in a fortunate time, there appears to be no such rule in the case of the commencement of married life† The ceremony of taking home the bride (muklawa, gauna or daviragaman) should indeed be celebrated in the 1st, 3rd, 5th or 7th year after the marriage (or in the 1st, 3rd or 8th year in Jullundur).

The muklawa however has nothing whatever to do with the commencement of married life, as consummation may take place without it, or before it, and in some parts of these Provinces (e.g., in Dera Ismail Khan where the dolt or taking home of the bride occurs immediately after the marriage) it is not known at all. The muklawa does not occur among all Hindus, much less among all Muhammadans, and in most cases where the betrothal of a girl is not pun, i.e. where she is sold, the actual marriage ceremony probably tallies with the commencement of married life. Probably the month in which most marriages are celebrated is Baisakh, the first of which is so auspicious that it is not necessary to consult a Brahman (Dera Ghazi Khan.)

15. Seasonal birth-rate.—The Subsidiary Table C illustrating the birth-rate in each month of the two main religions in these Provinces is based on the returns for the ten years, 1891—1900.

It shows that the fewest births occur, in both religions, in May, after which month the rate increases, and the rise, gradual until July, becomes more marked in August-September, and the zenith is reached in October. Thereafter the rate falls steadily but slowly throughout November, December, January and February, dropping suddenly in March and then declining gradually to its nadir in May. This result is in accord with the popular idea, noted in Gurdaspur, that the cold season is the best for the commencement of married life.

Not only do the averages for the ten years give these regular results, but the deviations from them in any year are remarkably small. Occasionally the lowest birth-rate is in April or in June and the highest in September, November or, thrice in the decade, in December.

This auspicious period extended to 11 days in April, 1897.

[†] But there are fortunate occasions it would seem :-

[&]quot;Three days of the week, Monday, Thursday and Friday, and eight dates, 1st, 2nd, 3rd, 5th, 7th, 8th, 1oth and 1sth, from among the fifteen days of the first-half of the moon, and the night time up to 12 o'clock are considered propilious for the commencement of married life." (Suket.)

[†] There is no muklawa among Muhammadans and Mian, Janwal, Samal, Behal, and Dadwal Rajputa s muklawa generally does not mark the commencement of married life. (Gerdaspur.) 46

16. Seasonal deathrate.-The figures in the margin give the average death-rates for the decade amongst Hindus and Muhammadans in each month of the year. March and April are markedly most healthy October, months and closely followed by November, the most fatal in the case of both religions.

It is, however, interesting to observe that in the cold months, December-February, the death-rate among Muhammadans is far higher than among Hindus, while the hot dry months of April, May and June are far more fatal to the Hindu population. In both cases however it is clearly not the cold of the Punjab winter which kills, but the autumnal season, and this fact has an important bearing on the question of the effects of malaria on the population.

The fluctuations in the death-rate are very great as the following notes show:

In 1891 July was peculiarly fatal to Muhammadans (death-rate 4'2 per. mille), and October and November to Hindus. In 1892 October was very fatal

to both, but especially so to Muhammadans (rate 130 as against 86 amongst Hindus). In 1893 November and December were the worst months, and in 1894 October again was fatal to both, but more so to Hindus than to Muhammadans. In 1895 December was about equally fatal to both and this period of high mortality continued into January 1896.

In 1897 October and November were fatal to Hindus and Muhammadans respectively, and both in 1898 and 1899 November was on the whole the month of heaviest mortality, though October and December were also unhealthy. In 1900 October was conspicuously the month most fatal to both.

The healthiest months are those of the spring—March and April—though the period of lowest mortality is sometimes pushed forward to July, as in 1893-4-5-6 and in 1899.

It is interesting to notice that the Ramzan fast does not appear to increase the mortality in the least degree and that not infrequently it coincides with the period when the recorded death-rate is lowest among the Muhammadan population.

17. The health of the past decade,—The closing months of the year 1890 were unhealthy and a diminished birth-rate in 1891, (3102 per mille as against 3576 the average of the preceding five years as calculated on the census returns of 1891), was the result. The months of May-August 1891, showed the greatest deficiency, but the next four months exhibited an abnormally, high rate, which continued throughout 1892, when the rate was 3816 per 1,000. The increased accuracy of the statistics probably explains in part this sudden rise in the birth-rate, but the 1891 figures had exhibited a tendency to rise before the importance of correct vital statistics was impressed on District officers in April 1892, and 1891 was a fairly healthy year. The increase then, in 1892, appears to have been in the main a real one.

n 1893 exhibited a decreased birth-rate (34.99 per mille), 1892 having been acceptionally fatal year, but in 1894 the rate rose to 43.90, 1893 having been comparatively healthy. In 1895 and 1896 the rate remained at over 43 per mille (43.86 and 43.04), but in 1897 it fell to 42.6, still however remaining higher than the mean of the ten preceding years by 3.3 and in 1898 it fell again to 41 per mille: 1897 had been a year of severe scarcity. In 1899 the rate rose to 48.4, the highest rate recorded, but in 1900 it fell to 41.10 (on the population of 1891, or 37.76 on that of the census of 1901). Compared with other

Provinces of India the recorded Punjab birth-rate is very high, but the figures

Subsidiary Table A. for the past ten years show that more accurate registration probably accounts for this, as in 1891-93, when registration was not so thoroughly carried out, the

Punjab rate was below that of several other Provinces,

Year.				Total rates (per mille	From fever	18. Deaths.—

(Statement No.				Administration R	enorts. Punish	mgn mortanty.

(Statement No. VI appended to Sanitary Administration Reports, Punjab, high mortality 1891-1900.)

The deaths recorded as caused by fever are, roughly speaking, two-thirds of the total. No doubt many diseases are vaguely returned as fever merely because there is an apparent rise of temperature, but as the Civil Surgeon of Ambala has pointed out, years marked by a high death-rate from fever also show a high death-rate from bowel-complaints.

The diagram in the opposite page shows the actual mortality among infants under one year, children under 5, and persons of all ages, for each year of the past decade. It also shows the number of births, the area cropped according to the revenue returns, and the rainfall.

19. Rainfall.—The rainfall averages, which have been supplied by the Meteorological Department, indicate roughly the relative annual rainfall in these Provinces during the decade. But a point of almost greater importance than the amount is the seasonal distribution of the rainfall, and this cannot be represented in a diagram. The unhealthy autums of 1892 and 1900 were due, not to excess of rain in those years, but to the floods caused by abnormal falls during the monsoon.

PART II .- INCREASE AND DECREASE IN THE POPULATION.

20. The rate of increase at successive enumerations.—The dates on which the various enumerations of the Punjab have been made, and the areas covered in each case have been described in paragraph 7 of the Introduction.

The population in British Territory has increased since 1891 by 761 per cent, if we include the military posts in the Malakand, Dir, Swat, and Chitral, the Kurram Valley and the Shiranni Country, whose population was enumerated in 1901, but not in 1891. It has, however, only increased by 726 per cent. if we exclude those territories. In other words the inclusion of their population has added '35 per cent. to the population of the British Territory in the two Provinces.

The rates of increase, calculated for the population of the original area of the Punjab, at each successive enumeration are given below:—

					Population on	PERCENTAGE OF	INCREASE ON-

....

[Punjab, 1901.

The population of the Native States has thus increased by 14'6 since 1881, whereas that in British Territory has increased 18'6 per cent. In the 1881-91 decade the rate of increase in each was practically the same, but in the past ten Paragraph 22, Punjab Census Report, 1892. in population half as rapidly as the British

Territory.

21. The extension of cultivation. - In :890-91 the cultivated area in the British Districts amounted to 40,424 square miles. In 1899-1900 it was 43,587, an increase of 3,163 square miles or 7'8 per cent. These figures do not include the Kurram Valley or the trans-Frontier territories.

Thus the increase in the area under cultivation has more than kept pace with the growth of the population which has, as already noted, increased by 726 per cent. in British territory, since 1891. The great centre of extension has been in the Chenab Colony in which nearly 1,100,000 acres were under cultivation in 1899 and of this area 1,092,075 acres or 1,706 square miles were irrigated by flow from the Chenab Canal.

22. The development of irrigation.—The decade has been remarkable for the development of the system of canal irrigation in both Provinces. The total area returned as irrigated has increased by 25 per cent, that from Government canals by 71 and that from wells byless than 5 per cent, while irrigation from private canals and other sources shows a marked tendency to diminish, and not to increase.

Acres irrigated by-	18091900	1889-1890
Canals { State Private	4,243,524 823,729	2,475,741 884,109
Tanks	20,049	21,722
Wells	4,154,598*	3,959,427
Other sources	134,083	146,484
Total	 9,375,983	7,487,483

It is curious that the area irrigated by wells should show so small an increase,

				1900.	1890.
Masonry Kacha	***			274.851 73,859	219,940
Kacha	**	***	***	73,859	219,940 42,660

seeing that their number is much larger now than in 1889-90, since when masonry wells have increased 25 per cent., and temporary (kacha) wells by 73 per cent. and the only conclusion to be drawn is that the losses in cattle since the famine of

1897 have seriously affected the power of the people to make full use of their

23. The effect of impending revisions of assessment on the cultivated area. - The general opinion is that an impending revision of settlement in a degree affects the area under cultivation by inducing the agriculturists to let land remain waste until the settlement has been completed, but the Deputy Commissioner of Rawalpindi remarks :-

"The tendency to not to break up land for some years before the expiry of a settlement exists only with the wealthy land-holders who are proprietors of one or more villages. The poorer zamindars are not given to this practice.

And Mr. E. D. Maclagan, Settlement Collector, Multan says:-

"In a few places no doubt wells were purposely allowed to go out of use in view of the revision of assessment, but this can have had no appreciable effect on the population returns, as it is done on a very small scale indeed."

Probably the Settlement Collector of Jhelum, Mr. W. S. Talbot, is very near the facts in writing :-

"It is true that there is a tendency not to increase cultivation when a District is under settlement, or about to come under settlement; but it is not a very postured tendency, and I do not think that it in any way affects the population returns. There is no scope for extension of cultivation on a large scale in this District."

[•] This area is rather above than below the average as the figures below show:—
in 1895-96 the well-irrigated area was 3,730,789
1896-97 , , , , , 4,006,984

24. The effect of revenue assessments on population.—The movement of the population appears to be unaffected, at least to any appreciable extent, by the character of the revenue assessments imposed. The only instance of an unfavourable assessment referred to in the District reports is in Gurgaon, and regarding this the Deputy Commissioner writes:—

"There is no doubt that in the Palwal Khadir there was a considerable exodus of the people during the middle years of the past decade. They are now however fast returning owing to the reductions granted in their assessments and thanks to recent good harvests. The Census returns do not therefore show any decrease of population in this tract, but an increase from 18,152 in 1891 to 19,516 in 1901."

25. Local fluctuations in population.—I propose to examine the figures not only of each District and State, but, in British Territory, of each Tahsil and where necessary, of even smaller areas, in detail. Tedious as this examination must be it is necessary for the purposes in view.

Those purposes are two-fold. On the one hand it is important to ascertain, as closely as we can, the effect on the population of the famines of the past decade. On the other hand an attempt will be made to trace the connection between swampage and malaria, in so far as that question can be elucidated by statistics of population. In both cases it will be found that everything cannot be proved by statistics, and that the utmost which the Census returns can do is to indicate certain provisional conclusions and, possibly, lines of further enquiry. Still less will an examination of the mere numbers enumerated in any tract lead us to any definite conclusions. For example, we shall find that in the case of Hissar the famines of the last few years have apparently only checked the normal growth of the population in numbers, but if we examine the ages of the population of that District it will be at once clear that one effect of the continued scarcity has been to diminish the number of children, so that, if our figures are correct and the conclusion drawn from them justified, the full consequences of the famines in that District may not be fully apparent for a generation.

The second question, the connection between swampage and malaria, is one which does not readily lend itself to statistical treatment. The Deputy Commissioner of Kangra (Captain B. O. Roe) writing on this subject, says:—

"The total of figures for the villages affected by river action have also been examined and show a falling off of 4 per cent, in population. These are the villages most affected by malaria. The influence of malaria might also be locked for in villages growing rice, but in no case can the alteration in population be safely attributed to malaria without the fullest enquiry. The Tahsildars attribute other causes to the differences, village by village. It must be borne in mind that these low-lying and also higher irrigated lands are usually very valuable and cultivators dying prematurely would ordinarily be replaced immediately by outsiders. The death-returns* would therefore be a more valuable guide than the census figures."

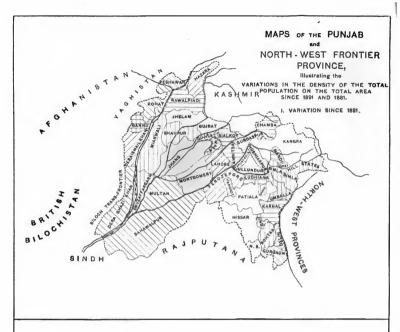

These observations are perfectly just. Precisely the same remarks would apply to the unhealthy, malaria-stricken, Naili tract in Ambala and Karnal, and in both cases an examination of the data for ages will be required.

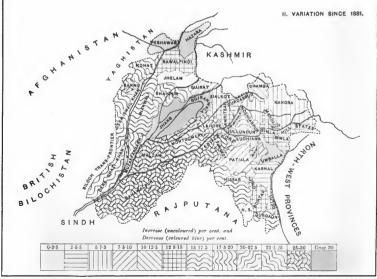

With these remarks I pass on to an examination of the figures in detail, adding in each case such information as I have been able to gather from the reports received.

26. Fluctuations in the numbers of the female population.—Light can often be thrown on the question whether an increase or decrease in population is temporary or permanent in character by an examination of the proportion of the sexes among the increased or decreased numbers. Women, if we put aside marriage which is a great cause of migration, do not emigrate readily even in seasons of severe scarcity, the men alone leaving their homes in search of employment or subsistence. A decrease in the number of females therefore probably indicates a more or less permanent decline in population, while a decrease in the number of females only may simply mean that men

G: paragraph 134. Punjab Census Report, 1883. of males only may simply mean that men have migrated temporarily. Similarly an equal increase in the numbers of males and females will usually denote a permanent increase, but to this there are exceptions in the case of newly colonised tracts in which an increase is at first found only among the males, who act as pioneers, the number of females gradually increasing as the tract settles down. The Chenab Colony is an instance of males being largely in excess though the immigration to that tract must be almost wholly permanent in character.

^{*} Provided we had separate death returns for the population born in those villages, and exclusive of the deaths among the immigrants who replace the indigenous inhabitants as they die out.

	TOTAL	[781,717	776,006	672,569

-As the District Which Plain, Wast. suffered most severely from famines in the past decade

The District as a whole shows an increase of 5,711 souls (3,258 males and 2,453 females) or much less than 1 per cent. on the population of 1891, but two of its Tahsils, Bhiwani and Sirsa, show decreases of 3,365 and 19,935 souls respectively. Bhiwani town shows a small increase and Sirsa town a decrease of only 615 people, so the decrease can in neither case be attributed to the decay of the smaller towns noticeable elsewhere.

Of the population of the District (781,717) 637,186 or 81'5 per cent. are District-born as against 628,696 or 81 per cent. of the population in 1891, which shows that immigration was both absolutely and relatively less in March 1901 than it

was in February 1891. This is so far satisfactory.*

Examination of the figures of increase or decrease by sexes also appears to

		Tahsil,		INCREASE + O		
					Males.	Females.

Sirsa	***	***	4+4		-11,403	-8.532
Fatehabi	d	***	***	1	+ 5.575	+ 3,708

show that the effect of the famines on the population has been far less than one would have anticipated.

the Hissar returns are of special interest and I give the figures for its Tahsils in the margin.

In Tahsil Hissar twothirds, and in Fatehabad three-fifths of the increase is composed of males, and in Hansi the added females only slightly out-number the males. Again in Sirsa Bhiwani and the

decreases among the females are not so great as among the males, and thus it would appear that the male has migrated from the dry, famine-stricken Tahsils of Bhiwani and Sirsa to the irrigated tracts more readily than the female population and that the latter was driven by want from Sirsa Tahsil only, in any numbers, and not from Bhiwani. The fiscal history of the Hissar Gazetteer, 1892, Chapter III, E. (Tenures). Hissar District is of special interest, and the tenant element is of great importance in its social and agricultural economy. The cultivation of the unirrigated lands is precarious, depending entirely on the uncertain rainfall, and is mainly carried on by a moving population and not by strong proprietary bodies of the usual Punjab type. Its great development which took place before the Census of 1868 was to some extent artificial and it may be doubted whether its natural resources were or are equal to the support of a large and permanent population.

Both in the case of Bhiwani and Sirsa we find that in the decade 1881-1801 the population increased abnormally, Bhiwani showing an increase of nearly 24 and Sirsa of over 14 per cent. Thus in 1891 both Tahsils were probably overpopulated and since then there has been a re-action. Bhiwani still shows an increase of over 20 per cent. in the figures of 1881, while Sirsa has not lost ground

since that year.

The Deputy Commissioner alluding to the famines of 1896-1897 and 1899-

	Tahsil	CANAL IRRIGIN ACRE		
			1890-91.	1899-1900.
Hissar		***	 11,352	32,794

*	***	TOTAL	 90,855	172,990

1900, points out that excepting 1895 the years of the past decade prior to 1896 were good or average and left the people with some reserve of money and physical strength to combat the period of scarcity and famine. The first famine of 1896-97, however, went far to exhaust their resources, 1897-98 was a year of only moderate yield

uring the decade 1891-1900, 307,042 births were registered, a number exceeding the registered deaths by This accords very closely with the increase (8,490) in the District-born population.

and in 1898-1899 the crops were poor, so that 1899-1900 found the District totally unprepared to face a second and more severe famine. The extension of canal irrigation especially in Fatehabad has undoubtedly had a great influence on the population of the District, Bhiwani and Sirsa Tahsils being virtually 'unprotected' tracts. Although irrigation in Hansi Tahsil had reached its maximum in 1890-1891, it is remarked that during the famines the canal irrigated villages 'kept up' the population of those not so protected. The famines appear to have chiefly affected the Pachhadas and the Bagri Jats who form the least stable element in the population.

28. Loharu State,-The State of Loharu, geographically part of the Hissar District, now returns 15,229 souls, a decrease of 4,910 or a fourth of its 1801

population. 1,022 of its native population were enumerated in Hissar.

20. Rohtak District.-The Rohtak District shows an increase of 40,197, (19,775 males and 20,422 females) or close on 7 per cent. and has now a population of 630,672 of whom 528,842 are returned as District-born as against 490,569 in 1891, an increase of 78 per cent. These results are eminently good seeing that famine prevailed in this District, though not to anything like the same extent as in Hissar, in 1897 and in 1899.

Jhajjar Tahsil suffered most from famine and its population has only increas-

ed about 3'2 per cent. It is not protected by canals and well-irrigation failed. The other Tahsils show increases of 6'3 (Gohana), 8'4 (Sampla) and 8'3

(Rohtak) per cent.

Gohana is fully protected, while Sampla and Rohtak are partially protected by canals.

A scrutiny of the population-returns for villages was made by the Revenue

Assistant (Malik Mehdi Khan) with the following results:-

Khirwali from . Sanghi , . . 4,911 to 4,658 show a decrease, and of these 6 only 2 show a serious falling off since 1891. It is remarked that in this tract canal and rain water used to collect and deteriorate the climate. A channel was constructed which has remedied matters but malaria still prevails in the rainy season.

Tabsil Jhajjar .- In the Rosli Rain Circle, 8, in the Bhur Kachcha, 15, in the Bhur Pakka, 29, and in the Dheri, 6 villages show a decreased population. These Circles suffered from famine and cholera. The first has no irrigation at all: the Bhur Circles, though well-land Circles, suffered from the fact that in dry seasons the wells become brackish and " yield no crop": in the Dehri the kamin classes emigrated owing to a deficiency in the supply of drinking water.

Tahsil Gohana.-There has been a decrease in 14 villages of the Central Canal Circle only. This Circle receives canal water in abundance, and in consequence the climate is very damp, and malarial fever occurs every year. The District note, however, goes on to say that the Canal has been extended and no

Vallana Vora iton		•	•	•	140	11	71	populated, is the most prosperous in the District.

6,103 .. 5,974

Tahsil Sampla .- 7 villages in the Canal Circle show a decrease, most marked in the 5 villages noted. Bahadur-Silanah from Bidhlan " . 2.347 to 1,960 1,952 ,, 1,850 5,446 ,, 5.272 garh is a small town and is probably Sisana ... decaying like so many other towns of 1,472 , 1,397 816 , 675 the same character.

great increase in population.

52

The births returned in 1891—1900 were 256,123, in number and exceeded the deaths recorded by 54,206. The births returned in 1891—1900 were 256,123, in number and exceeded the deaths recorded by 54,206 and 1892 in the second of the control of the control of the second of the control of the period of the period of the returner's as

satimated increase according to the vine management of the property of the pro

The District has undoubtedly been saved from disaster by the extension of Canal irrigation, five new raj-bahas having been opened since 1891. The population in the villages in these raj-bahas has risen rapidly.

- 30. Dujana State.—The Dujana State now returns 24,174 souls, a decrease of 2,276 or nearly 9 per cent. 1,996 of its State-born population were enumerated in Rohtak and 1,288 in Gurgaon.
- 31. Gurgaon District.—The population of Gurgaon has risen from 668,929 to 746,208 an increase of 77,279 (40,214 males and 37,065 females), since 1891, in spite of the famine which prevailed in 1896-97, and 1899-1900, the former being a period of scarcity rather than of famine.

The increase in each Tahsil is large, but Palwal and Firozpur-Jhirka show the highest increases, the former being protected by the Agra Canal, while Firozpur has recovered from a set-back in the 1881-91 decade.

The increase is almost entirely confined to the rural areas, the towns of Rewari, Hathin and Hodal showing decreased populations. The Deputy Commissioner, however, remarks that 'the close of the famine has left the people very much in the same condition as they were before the famine with a burden of debt added, and the famine was profitable to the traders in grain who had hoards of it in stock, and sold it at high prices while the butchers amassed wealth by the trade in hides.'

- 32. Pataudi State.—Pataudi which belongs geographically to Gurgaon had an increase of 2,931 souls and now returns 21,933. It gains by immigration from Gurgaon.
- 33. Delhi District.—The District population (689,039) has increased by 50,350 or 7'8 per cent. and the increase is distributed thus:—

```
      Delhi City
      ...
      ...
      +15,996

      Delhi Tahsil (excluding City)
      ...
      ...
      +13,465

      Sonepat
      ...
      ...
      +13,848

      Ballabgarh
      ...
      ...
      ...
      +7,041
```

The District-born population, however, has increased from 498,328 to 534,104 an increase of 35,776, or only 7.2 per cent.

The Deputy Commissioner writes:—"There is no doubt that the health of the District has benefited by the many seasons of drought which have occurred during the decade. The scarcity has never been severe enough to lower the death rate by starvation, whereas the absence of floods has diminished the scourge of malaria." In Delhi Tahsil every Assessment Circle shows an increase.

In Sonepat and Ballabgarh Tahsils the villages of the Khadir on the Jamna show decreases of population and this is attributed to swampage, the flood-water accumulating round them in the rainy season.

Tahsil Sonepat.—Of the former Tahsil the villages chiefly affected are noted in the margin. Besides these Khadir villages Basantpur, a very small village, has fallen from 7,7 to 35 inhabitants owing to flooding and Ahulana has fallen from 1,885 to 1,761 owing to

from 1,885 to 1,761 owing to its unhealthy climate. The adjacent villages of Bali Qutbpur, Sardhana, Pugthala

The District-born population has increased from 546,035 in 1891 to 612,863 in 1901, i.e. by 66,828, or 122 per ent. The births returned in 1891-1900 (314,140) exceeded the deaths by 77,457.

This number exercit the estimated increase from the viral statistical returns, 2,96% more birth having been recorded than deaths in 8,96 — 1000, and it be the city of Deblit the deaths in 8,96% more ded the birth by 3,800 so that, excluding the city, the births in the District-tone decade the births by 3,800 so that, excluding the city, the births in the District-tone population which is citefly found in the District-tone consistent City.

and Bijana also show a decrease and apparently the neighbourhood of Ahulana generally is not healthy. The decreases in Nandnaur (458 to 333) and Asadpur (410 to 316) are not explained.

The population of Tahsil Sonepat has nevertheless risen by 7'3 per cent.

In Ballabgarh Tahsil the Khadir Circle shows a decrease of about 4 per cent, but the diluvion of some 2,000 acres is assigned as the cause of this. The population of Ballabgarh Tahsil, as a whole, shows an increase of 5.8 per cent.

It would thus appear that the Western Jumna and Agra Canals have ceased to cause injury in this District, the Khadir tract alone being affected by natural swampage.

34. Karnal District.—This District, as now constituted, shows an increase of 22,065 souls on the figures of 1891, having now a population of 883,225 or an increase of 2'56 per cent. on the figures of 1891, of whom 739,129 or 83'7 per cent. of the total are District-born.

Tahsil Karnal.—The population has risen from 241,365 to 248,544, an increase of 7,175 souls, of whom less than 6,000 however belong to the rural areas, Karnal town having a larger population than in 1891 by some 1,600 persons.

This increase is however by no means uniform. In Pargana Karnal the Khadar Circle shows a merely nominal increase, the Bangar a satisfactory increase of over 8 per cent. and the Nardak of over 12 per cent. The District Census Report says:—

"The figures do not exhibit any matter for serious alarm. In Karnal Pargana the population is stationary in the Khadar Circle but in the other two circles the increase is considerable. In the Karnal Nardak, where canal irrigation has been extended by the Chautang Project and the Nardak Rajbaba, and which has benefitted by the realignment of the Western Jumna Canal and the carrying out of drainage works, the increase in population has been steady; from 40,536 in 1881 the figures have gone to 53,173 in 1901 or an increase of 12,637 or 31 per cent. in twenty years."

In Pargana Indri the Khadar Circle shows an increase of about 5 per cent, though its population is still less than it was in 1881, but both the Bangar and Nardak Circles show marked decreases, and the population of the pargana as a whole has fallen from 113,867 in 1891 to 110,047 in 1901.

The Deputy Commissioner remarks :- "In Indri Pargana the Khadar Circle

	Total.	1881.	1891.	1901,
Khadar	***	 50,406	46,619	49,010
Bangar Nardak	***	 35,301 23,818	38,084	34.831 26,206

though showing an increase of 2,391 souls has not yet made up the loss of the previous decade. The new Sirsa Branch has injuriously affected the health of some 26 villages in Karnal and Thanesar on its banks." The figures for each Circle are

given in the margin. The canal irrigated area in this Tahsil rose from 26,467 acres in 1891 to 49,633 in 1901 or nearly double.

Tahsil Panipat.—The population has increased from 184,856 to 196,284 or 6·18 per cent., having thus recovered from the check it received in the previous decade when it fell slightly. It has now a density of 425 persons to the square mile, and this being so its progress is satisfactory. In the healthier Bangar tract the population has increased over 6 per cent. but in the Khadar by less than 4 per cent.

Tahsil Thanesar.—This is the only Tahsil in the District which shows a decrease, as a whole, and this decrease follows a heavy falling off in the 1881-off decade. In 1881 the Tahsil had a population of 209,341, in 1891 of 177,442 and in 1901 of 173,208, so that in 20 years it has lost 17 per cent. of its population. The town of Thanesar has contributed but little to this decrease. It is a

^{*} Comparison of the latter figures with those of 1891 is not possible as the District did not then include Thanesar Tahril and there are no figures by Tahrils for the District-born population of 1891.

small town—of only 5,066 inhabitants or 1,045 less than in 1891. The decrease in the whole Tahsil amounts to no less than 36,133 persons (19,712 males and 16,421 females), or over 35,000 in the tural area alone.

The Deputy Commissioner says :-

"The worst Tahsil as regards canal irrigation is Thanesar where the whole area is insecure. The largest decrease in the population is in the Bangar Circle, which shows a falling off of 10.6 per cent. during the past decade. The Tahsildar's explanation of the variations in the several circles is given below:

"Bangar.—This was the unirrigated tract most affected by scarcity: the area is mostly barani. Chholandi, Chandhera and Muradnagar on the Jumna Canal have a very damp climate and the mortality is large. The Kamins have, owing to scarcity, left their villages and gone to Jagadhri Tahsil and Saharanpur.

Betmarkanda.—Scarcity prevailed here as also fever, which carried off a large number of the people.

Chhachra Janubi.—This circle shows an increase of 1,538 souls. The village of Bir Sundi has been newly peopled; in Kolapur, Partabgarh and Khairi malis from Amballa have come and settled since 1891: in Devidaspur 255 malis have settled during the past four years from Tahsils Rupar and Kharar. Several villages in this circle have gone down."

A list of 15 villages in the Bangar Circle which have lost 30 per cent. or more of their population since 1891 is given, and more than half the villages in this Circle show a decrease.

Tahsil Kaithal.—With a population of 204,734 in 1881, of 257,493 in 1901—an increase of nearly 30 per cent. in 20 years, Kaithal Tahsil might be considered conspicuously prosperous, yet it contains the most unhealthy tract in the District. Irrigated by the Sirsa Branch of the Western Jumna Canal since 1892-93 cultivation has greatly increased, but the climate is said to have deteriorated.

The naturally unhealthy Naili Tract shows a further decrease of population,

		1881.	1891,	1901.
Total	::	54.154	53 813	46.649
Pehowa Naili (53 villages)		19.803	18,408	16,658
Kaithal (98 villages)		34:351	53,813	46,649

amounting to 13 per cent. in the past decade. To relieve this tract the Sarsuit Canal was commenced, partly as a Famine Relief Work, in 1897. It was expected that this canal would drain the Sainsa Jhi and protect a portion of the tract

from flooding, and it appears that though not yet in full working order it has to some extent diminished the injury formerly done by the floods.

Besides this tract both the Pehowa Bangar and Indarwar Circles show a slight decrease in population.

There has thus been a falling off in the Bangar Circles of Indri, Thanesar and Pehowa but not of Karnal, Panipat or Kaithal. Of the Nardak Circles that of Indri alone shows a decrease. The Bet Markanda and Northern Chhachra in Thanesar show very small decreases, and the Naili a very heavy one.

The displacement of the population in this District is remarkable and appears to be almost entirely due to the development of the canal system.

The cultivated area has increased from 1,605 square miles in 1891 to 1,752 in 1901, the most noteworthy improvement being in the irrigated area of Kaithal Tahsil which is now 190 square miles as compared with 52 in 1801.

35. Jullundur District.—As already stated the District of Jullundur is the most densely populated in these Provinces, and it has no canal irrigation though it is amply protected by wells. The Deputy Commissioner remarks that the scarcity was not as a rule felt by the cultivators of the District, as the decrease in produce was made good by the high prices which prevailed, but they lost their cattle owing to scarcity of fodder. The chief sufferers during the scarcity are said to have been the daryaibds or weavers of silk cloth.

In spite of the fact that the District contributed 56,983 settlers to the Chenab Colony, its population increased from 907,583 to 917,587, i.e., by 10,004 or 1'1 per cent, and the ratio of District-born to the total population rose from

86'2 to 87'2 per cent.* Another sign that this increase was not due to an influx of refugees from less favoured Districts is that females have increased by 6191 and males by 3,813.

Tahsil Jullundur.—The population in this Tahsil has increased from 295,301 to 305,976 or by 3'6 per cent. Excluding the town and cantonment it has increased from 229,099 to 238,241 or by 3'9 per cent., and of the increased numbers (9,142) 5,108 are females and 4,034 males.

Tahsil Nawashahr.—This Tahsil alone shows a decrease. The population fell from 205,625 to 196,339 a decrease of 9,286 or 4.5 per cent. and the females have decreased more than the males (4,974 as against 4,312.)

Tahsil Nakodar.—The population rose by 2'4 per cent. from 217,079 in 1891 to 222,412 in 1901, an increase of 5,333 (3,170 females and 2,163 males).

Tahsil Phillour.—The population rose from 189,578 to 192,860, an increase of 3,282 (2,100 males and 1,182 females) or 1.7 per cent.

- 36. Kapurthala State.—Kapurthala has now a population of 314,351, as against 253,617 in 1881, an increase of 24'4 per cent. Its great increase was in 1881-1891, but since the latter year it has added 14,661 to its population, an increase of nearly 5 per cent. as against 1'1 in the Jullundur District, but it has only contributed 3,968 settlers to the Chenab Colony whereas Jullundur sent over 56,000.
- 37. Ludhiana District.—The District population has increased from 648,722 in 1891 to 673,097 in 1901 or by 3'7 per cent., but Tahsil Samrala exhibits a decrease of nearly 4,000. The percentage of District-born is now 82'9 having fallen from 83'5 per cent. in 1891.†

The District contributed 17,807 souls to the population of the Chenab Colony in addition to an increase of 16,630 in the number of the District-born.

Tahsil Ludhiana.—The population has risen from 323,700 to 333,337 or by 9,637 souls, of whom 2,315 are included in the town of Ludhiana. Hence the increase in the rural population (now 284,688) is 7,322 or 2.6 per cent. only.

The Deputy Commissioner writes :-

"In the Ludhiana Bet the soil is bad and has not improved since Settlement and many villagers have been attracted to the Chenab Canals, but the tract is far from being as damp as the Samrala Bet and the falling off is far less marked and general."

Tahsil Samrala.—The total population has decreased from 158,770 in 1891 to 154,995 in 1901 or by 3,775, (i.e., by 2'4 per cent.) in spite of a slight increase in the small urban population, and the Deputy Commissioner writes:—

"Serious variations in population are found only in the Samrala and Eastern Ludhiaua Bet. The falling off in population becomes more and more marked as we approach the Eastern boundary of the Samrala Bet and the tract is notoriously unhealthy. Much of its land is water logged and its condition goes to prove the connection between malaria and high water-levels."

Tahsil Jagraon.—The population has risen from 166,252 to 184,765, an increase of 18,513, or 11'1 per cent. and this increase is practically confined to the rural area.

- 38. Maler Kotla State.—Maler Kotla has added 1,751 to its population, now 77,506, since 1891—an increase of 2 per cent. Its increase since 1881 amounts to 6,455 or over 9 per cent. The District of Ludhiana has risen by nearly 89 per cent. since 1881.
- 39. Ferozepur.—The population of the District has increased from 886,676 in 1891 to 958,072 in 1901—or by 71,396 souls—an increase of 8 per cent, but the District-born population has only risen from 683,696 to 731,516—an increase of less than 7 per cent.† The District has, however, contributed 15,048 settlers to the Chenab Colony, so that the real increase is larger.

As the following notes on the different Tahsils show the displacement of the population in this District has been curiously unequal. The Tahsils of Ferozepur

The births returned in 1891-1900 numbered 385,469 and exceeded the deaths by 83,213, whereas the District-born population only increased by 18,746. But adding to the latter the settlers in the Chenab Golony the returns are inclose agreement.

[†] The births recorded in the decade exceeded the deaths by 50,191.

[‡] Thus the District-born population has increased by 47,547, whereas the births in the decade 1891-1900 out-numbered the registered deaths by 44,968 only.

and Zira, which comprise most of the Bet or riverain tracts, are not progressing, Ferozepur indeed shows a serious decrease, while Zira is practically stationary. Parts of Moga Tahsil which is entirely Rohi or upland also appear to be retrogressing. 'It appears,' says a District note, 'that the decrease (in 445 villages of these three Tahsils) has occurred rather in the Rohi Circles than in the Bet. The reason is that in 1900 the rainfall was unusually heavy: this caused fever everywhere, and the death-rate was high.' The people of the Bet were accustomed to the effects of inundation and suffered less, whereas those of the Rohi were more seriously affected by malaria. Emigration to the Chenab Colony, Bikanir and Bahawalpur is, however, also assigned as a cause of the decreased population in both Circles.

On the other hand, the decrease in certain villages of Tahsil Muktsar is attributed to scarcity, and to the fever epidemic of 1900, but it is added that:—"Of course the population increases much more in the upland Rohi with a Jat population than in the lowlands inhabited by miscellaneous Mohammadan tribes."

Tahsil Ferozepur.—This Tahsil has now a population of 165,851 as against 179,606 in 1891—a decrease of 13,755 souls or 7'6 per cent., only to a slight extent explained by a decrease in the Cantonment population of 1,006. The population of the rural areas has in fact decreased by 9'6 per cent. The District Census Report attributes this to the "terrible mortality from fever" in 1900 and the Revenue Assistant in a note points out that 221 out of 358 villages show a decreased population.

Tahsil Zira.—The population has increased from 174,138 to 176,462 or : '3 per cent only. Out of 363 villages 154 show an actual decrease of population.

Tahsil Moga.—The population has risen by 10,051 and is now 245,857 or 4.2 per cent. more than in 1891. 70 of its 208 villages show a decreased population. The District report thus comments on the figures:

"The increase is very small considering the Tahsil's capabilities of expansion. But there are definite causes for this:—

(i) the numbers who have gone to the Chenab Colony;

(ii) the large numbers who have gone to Hong-Kong, Uganda, the Straits Settlements, etc.

It is a fact that some Rs. 2.00,000 are yearly remitted to Moga from those parts. The Moga Jat is restless man and likes foreign service. It is quite a common thing for a man who is wanted by the police to go off to China or the Straits."

Tahsil Muktsar.—The population, now 172,445, has risen by 10,953 or nearly 7 per cent. This Tahsil has greater 'possibilities of expansion which have been checked by the recent scarcity.'

Tahsil Fazilka.—This Tahsil shows the greatest development, having added 61,823 to its population in the decade. It has now a population of 107,457, or over 45 per cent. more than in 1891, and 188,952 of this is rural. This expansion is due to extended irrigation and the opening of the Southern Punjab Railway.

40. Faridkot State.—Faridkot has now a population of 124,912 as against 97,034 in 1831—an increase of nearly 29 per cent., and it has increased by over 8 per cent., since 1891.

41. The Phulkian States .- Patiala with a present population of 1,596,692

Tota	Per cent			
Patiala		***		8.8
Nabha	100	***	***	137
lind	***	***	***	13.8

has increased by only 13,171 or '83 per cent, since 1891: Nabha with 297,949 has added 15,193 or 573 per cent to its population: while Yind with 282,003 shows a small decrease of 2,557 or '89 per cent.

42 Lahore District.—The District has now a population of 1,162,109 as against 1,075,379 in 1891, an increase of 86,730 or 8 per cent., but the Lahore City with Mian Mir Cantonment accounts for 26,110 of this increase. Nevertheless, excluding the city and Mian Mir Cantonment, the population of the District has risen by nearly 7 per cent. and its proportion of District-born has

risen considerably, being now 948,410 or 81'6 as against 853,070 or 79'3 per cent, of the total population in 1891, so that immigrants are relatively fewer than in 1891. Females, however, have not increased nearly so rapidly as males, there being now 48,156 more males, but only 38,574 more females in 1901 than in 1891.

Tahsil Lahore.—In the whole Tahsil the population has risen from 430,378 to 474,181 or by 10'2 per cent. and that in the rural areas from 253,524 to 271,217 or nearly 7 per cent. Of the increased numbers, (17,693), in rural areas 9,018 are males and 8,675 females.

Tahsil Sharakpur,—The population has decreased from 133,457 in 1891 to 118,957 or by 14,500, equal to 10'8 per cent., but the females have not decreased so rapidly as the males, there being only 6,606 fewer females as against 7,894 males.

Tahsil Kasur.—The population has risen from 280,647 to 311,690, an increase of 31,043, or in rural areas alone from 240,927 to 275,398, an increase of 11'5 per cent, but the increase in the number of males is (16,174) greater than that of females (12,297) in the latter.

Tahsil Chunian.—The population now 257,281 has risen from 230,897 or by over 11 per cent. and as females have increased more rapidly than males the increase is doubtless permanent.

The administrative Tahsil however correspond so little with the natural divisions of this District that it is best to discuss the circumstances of the latter as has been done by the Revenue Assistant, Lala Tilok Chand, in the following note:—

- "I would divide the Lahore District into four sub-divisions, namely :-
 - 1. the tract lying north of the Ravi river and forming the Sharakpur Tahsil,
 - 2. the low-lying tract commanded by the Ravi,
 - the high tract or Manjha lying between the Ravi and the Sutlej,
 the low-lying tract known as the old Beas valley and now commanded by the Sutlej.
- 4. The statistics show an abnormal decrease of population in most of the villages of the first two sub-divisions, while a marked increase is observable in the third. The decrease in the fourth sub-division is comparatively small.
- 5. The causes of these notable variations are not far to seek. The first two divisions are dependent for their irrigation on rainfall, generally aided by wells, and partly by the river spills and seasonal overflow from the Deg stream. During the long continued drought which commenced in 1895 and ended in 1900, the river and the Deg did not overflow their banks and the people could not work their wells with profit owing to the great scarcity of fodder. Accordingly, they were obliged to abandon their homes to seek a livelihood in more favoured tracts. The Chenab Colony adjoining the Sharakpur Tahsil (first sub-division) and the Manjha tract adjoining the second and fourth sub-divisions had ample room for them, as irrigation from the Chenab and Bari Doab Canals was extended to a large area during the decade. In the Chenab Colony the Gugera branch was opened, and a new colony was made in the Chunian Tahsil where the Bari Doab Canal was extended. At the same time many Manjha villages welcomed the hard-pressed people of the Ravi and the Sutlej.

The cause of the comparatively small decrease in the fourth sub-division seems to be that the tract is partly irrigated by the Sutlej inundation canals and therefore the drought did not prove as disastrous there as on the Ravi and in the Sharakpur Tabsil (first two sub-divisions)."

43. Amritsar District.—The population of this District has risen from 992,697 in 1891 to 1,023,828 in 1901, an increase of 31,131 or 3'1 per cent, of whom less than half are females (males 16,771, females, 14,360). The increase in Amritsar City alone, however, amounts to 25,663, so that, excluding the city, the District has an increased population of only 5,468 or a little over '5 per cent.

The District has contributed 67,963 settlers to the Chenab Colony, yet the percentage of District-born to the total population has only decreased from 86.7 in 1891 to 85.3 in 1901.

The Deputy Commissioner notes that a very large number of wells have been sunk since the last Settlement, and that there is extensive canal irrigation, but he adds:—

"Though the canal brings many benefits still there are many tracts excessively irrigated from it and this must result in excessive mortality from malarial fever."

The births recorded, however, only number 462,079 or 81,688 more than the recorded deaths in 1891-1900, whereas the District-born population has increased by 95,340.

Tahsil Amritsar.—The population has risen from 462,734 to 488,383, but the increase is entirely in the city of Amritsar which has increased by 25,663 soils, rural areas showing a decrease of 18 (+532 females and -550 males).

Tahsil Ajnala.—The population has fallen from 224,836 to 209,869, a decrease of 14,967, or 6.6.—8,359 being males and 6,608 females.

Tahsil Tarn Taran.—The population now 325,576, has risen by 20,449 since 1891 or by 6.7 per cent.

44. Nahan State.—The progressive Hill State of Nahan has now a population of 135,687 or 23,316 more than in 1881, an increase of 21 per cent. It has added 11,553 to its population since 1891.

- 45. Simla District.—The District as now constituted shows an increase of 45. So, over 2,500 of these being accounted for by immigrant labourers on the Kalka-Simla Railway. The town of Simla tiself, with Kasumpti and Jutogh, shows an increase of nearly 700 souls, while the rural population, now 21,449, has increased by only 237 souls according to the District report, though the increase appears to be greater. It is remarkable that according to the vital statistical returns 1,748 fewer births than deaths have been registered in this District since 1891. In only one year, 1808, did the births exceed the deaths. This appears to indicate very imperfect registration of births in the Simla Municipality, but the circumstances of the District, as a whole, with its large floating population (only 18,544, out of a total population of 40,351 are returned as District.
- 46 Simia Hill States.—These, as a whole, show an increase most marked in Bashahr (11.76 per cent.), Keonthal (13.05 per cent.), and in Balsan, Kumharsain, Bhajji and Baghal. Nalagarh shows a marked decrease of 2.75 per cent., and Jubbal, Bilaspur, Mailog, Bija and Darkoti small decreases. The population in all the States taken together has risen from 371,335 in 1891 to 389,349—or by 4.8 per cent. only—since 1891.

born) are exceptional and no certain conclusions can be drawn.

47. Kangra.—The conditions of this District are peculiar. There would appear to be but little room for extension of cultivation, the people are averse to emigration and the population remains almost stationary as the marginal figures show, though those of 1868 have been held to be not very trustworthy.

The District-born population now amounts to 720,348, or 93'8 per cent. of the total, as against 718,830 or 94'2 per cent. in 1891, an almost nominal increase. The births registered however exceeded the deaths by 4,897, so that a somewhat higher increase might have been anticipated.

Tahsil Kangra.—The rural population is practically stationary having increased by 898 only.

Tahsil Nurpur.—This Tahsil shows a decrease of 2,606, and the District Census Report states:—

"An explanation which may be tentatively advanced is that a large proportion of the land in these Thasiis being poor will not well support an increase of population, and if there has been an increase in reality it has been drawn off by emigration for private and military service. In addition to the 37th and 38th Dogras another Dogra regiment is being raised, and there are Dogra companies in other regiments."

The falling off in Tahsil Hamirpur amounts to 1,281 souls, and the above explanation applies to this Tahsil also. The Dera Tahsil is absolutely stationary and the only Tahsil in Kangra proper which shows a real increase is that of Palampur which has now a population of 132,955 or 3,356 more than in 1891, or 2½ per cent. increase.

Kulu,—In the Kulu Sub-Division Plahch Sub-Tahsil again is stationary with a population of 50,631 or 80 more than in 1891, while Kulu Tahsil has now

HIMALAYAN AREA.

The rural population in 1891 was 24,089, but from this must be deducted 1,135, the then population of Rawain and Dhadhi States, and the rural population of Kalka and Kasauli, for which separate figures are not available.

68,954 or 4,324 more people than in 1891. Lahul and Spiti were however enumerated on the 1900 at the commencement of the cold weather instead of its close as in 1891, and this probably accounts for the difference in the figures. The

increase in the Kulu Valley has thus exceeded 3,000 souls.

48. Mandi State.—No Hill State shows a greater advance than Mandi, which has now a population 174,045 as against 147,017 in 1881, an increase of 18 per cent.

49. Suket State.—Suket has also increased by 2,192 or by 4 per cent. since 1881, having now a population of 54,676.

These two States have increased by over 14 per cent., and thus advanced more rapidly since 1881 than the British District of Kangra, which has only increased its population by a little over 5 per cent. since that year.

50. Chamba State.—Chamba, (127,834), has only increased by 3 per cent. since 1891, but in the 1881-91 decade it added 8,259 to its population and has thus risen by 10'5 per cent., again a greater increase than in the British District of Kangra.

THE MOVEMENT OF THE POPULATION IN THE HIMALAYAN AREA.

Percentage of increase or decrease. Percentage of increase or decrease, Males 1901. 1881. +19.30 +92.74 75.461 63,305 60,226 49,065 +12.80 +18. The figures of the Simla District being excluded from the table in the margin, as abnormal it will be seen that the females have as a rule increased perceptibly faster than the males during the past 20 years in the territories which form the

Himalayan Area.

AREA.

51. Ambala District.—The decrease of the population in Ambala from 863,644 souls in 1891 to 815,880 in 1901, a decrease of 47,761 or 5\frac{1}{2} per cent, Paragraph 8, page 83 of the Pusjab Ceasus is remarkable. The more so when it is Report, 1892.

Is remarkable. The more so when it is Report, 1892.

The more so when it is remembered that in 1881—91 the population was practically stationary. The District-born population is now returned at 685,062 or 83'9 per cent of the whole population enumerated. But as in the case of Karnal no comparison with the District-born figures of 1891 can be made because Thanesar Tahsil has been transferred to that District.

Tahsil Ambala .- Of the total decrease of 12,561, 11,905 appertain to

1891-1901			-7.489	-3,644	-3,845

Tahsil Rupar,-In this Tahsil also the same phenomenon appears.

Causes of the decrease .- No other District exhibits this phenomenon of a general decline in population, which decline is proportionately far heavier among the female than it is among the male element. It will be observed that in the 1881-91 decade the decrease was, (except in Tahsil Kharar), more marked amongst the males, the females in Jagadhri and Rupar showing small increases though the male population had diminished in the latter Tahsil by as many as 7,907. The number of deaths registered in the District (presumably as at present constituted) exceeded the births by 15,184 in the 1891-1900 decade. This is significant because the deaths of emigrants from the District would not, if they died outside its limits, be registered in it, and thus the number of deaths returned should no be increased but lessened by emigration so that the decrease in the population can hardly be attributed to that cause. Again defective registration of births and deaths will not explain the figures for, presumably, the former are not less carefully registered than the latter.

As pointed out in the District report the decrease is marked in the rural population of every Tahsil and it is indeed clear that the general decay of the smaller towns in no way explains this decadence in the population of the District. With the exception of Ambala itself, Buria, and Sadhaura, all the towns show an increased population.

The health of the District during the past decade is thus described by the Civil Surgeon :-

"Malarial fevers have been the chief cause in diminishing the population in the District. This is well illustrated in the accompanying diagram." The course of the disease corresponds almost exactly with the curve of the total deaths. It is interesting to note that years which are marked by a high death rate from fevers are also marked by high death rate from fevers are also marked by high death rate from fevers are also marked by high death rate from fevers are also marked by to note that years which are marked by a high death rate from fevers are also marked by a high death rate from bowel complaints (dysentery and diarrboa). Cholera prevailed in an epidemic form in the District in 1891-92, and again in 1895-96. There were 244 cases in 1900. Small-pox caused a severe epidemic in 1896 when there were 3,544 deaths from this cause. It has, however, steadily declined ever since and only 49 deaths occurred from it in 1900. There has been no other form of epidemic which could possibly affect the general population."

The District Census Report adds :-

"The chief cause of the decrease of population was the mortality caused by cholera, fevers and small-pox as stated by the Civil Surgeon. But to some extent it was also due

to the severe scarcity which prevailed through the larger portion of the District in the years 1896-97 and 1899-1900. Cases of actual starvation were probably not many but there can be no doubt that a large number of poorer people did not get sufficient and wholesome to discuss which otherwise would not have proved fatal. The fact that the decrease is most marked in Tabisis Ambala, Kharar and Naraingarth which suffered the most from scape. city is a clear proof that want of food was not an unimportant factor in reducing the population. The Tabislis of Rupar and Jagadhri have the rivers Sutlej and Jumna respectively on their borders and the Khadar Circles in these two Tabislis had generally good times when scarcity prevailed elsewhere. So the decrease in those two Tahsils is not so considerable as in the other three Tahsils.'

These remarks, however, in no way explain the decrease in the fertile Tahsils of Rupar and Jagadhri. As regards the latter Tahsil it is remarked that :-

"The Western Jumna Canal has done much harm to the health of the villages on its sides. Its banks being low the adjoining lands were generally full of water from percolation and floods in the beginning of the past decade. This gave rise to general weakness and malarial levers and the consequence was that the population of the canal side villages was much reduced. The Canal Department has, however, raised the embankments in many parts and percolation is gradually diminishing and it is hoped that as soon as the embankments are complete the health of the people in those villages will much improve."

A map prepared to show the localities in which population has diminished only renders the question what causes have led to this decrease throughout the District more obscure. The villages which return diminished populations are scattered throughout the District and not confined to any one part or tract.

Kalsia State. - This State has now a smaller population than in 1881 having now returned 67,181 persons as against 67,708 in 1881 and 68,633 in 1891. It is geographically a part of Tahsil Jagadhri in Ambala and shares its decad-

52. Hoshiarpur District.-Hoshiarpur has now a population of 989,782 as against 1,011,639 in 1891, a decrease of 21,877 or 2'1 per cent., two-thirds of the decrease being among the male population.

The District-born population has decreased from 932,137 in 1891 to 910,847 or by 2'3 per cent. and now amounts to 92 per cent. of the total population.

The births returned during the past decade (1891-1900) numbered 53,140 more than the recorded deaths, so that instead of a decrease of some 21,000 in the District-born population an increase of over 50,000 might have been anticipated. Emigration to the Chenab Colony accounts for 35,099 and the Revenue Assistant notes that numbers have also taken up land in the Native States

Born in Hoshiarpur. Nahan Mandi ... 3.805

of Nahan, Mandi and Suket, a fact borne out to some extent as regards Nahan but not as regards Mandi or Suket by the Census returns, which show Suket by the Census returns, which show the numbers given in the margin as enumerated in those States.

That the decrease, however, is to be chiefly accounted for by emigration will be clear from the fact that the female population has only decreased by 7,683, while the male has fallen by 14,194 or nearly twice as many. In Tahsils Garhshankar and Una the decrease is practically confined to the males, and in Dasuya it is chiefly among the latter (3,422 males to 1,920 females), but in Hoshiarpur Tahsil 4,031 less females to 5,721 less males are returned. The decrease of population in the latter Tahsil is probably permanent.

1890 91. 1899-1900. Dasuya ... Hoshiarpur ... 210,209 162,900 207,033 164,816 186,453 Garbsbankar... 173,891 169,912 Total ... 735.714 728,214

The Deputy Commissioner thus compares the cultivated area of the years kharif and rabi 1890-91 and kharif and rabi 1899-1900 by tahsils, and he adds :- "The destructive action of the chos has thrown much good land out of cultivation, while the new cultivation has no doubt been of inferior quality. This process has in all probability operated in the direction of a decrease in population by emigration."

The annual loss, in land revenue alone caused by the chos and rivers exceeds Rs. 32,000. On the other hand it is remarked that:

"The irrigated area of the District in 1891 was 45,193 acres and in 1900 it rose to 56,440. In other words the irrigated area has in to years risen by 25 per cent. According to the Revenue papers the number of pacca wells has increased by 2,000 since 1891. About \(\frac{1}{2} \) of the total increase in the irrigated area is nahri which is due to the development of irrigation from the Shah Nahr Canal in the Dasuya Tahsil."

Tahsil Hoshiarpur.-The population is now 264,112 souls a decrease of 9,752 but the town of Hoshiarpur (-4,003) accounts for nearly half the falling off. But in the Sirwal Assessment Circles the falling Sirwal I, Decrease -5,052. Sirwal II. -3,553.

by nearly 2,000 persons.

Sirwal	***	***	-2,549
Bet	***	***	-1,922
Maira	***	***	-950
Rakkar	***	***	-203

Tahsil Dasuya has now a population of 239,004 as against 244,346 in 1891, a decrease of 5,342. Here again the heaviest decrease is in the Sirwal, but the Bet also shows a large decrease.

-2,645 -1,227 -790 -371 -68

Tahsil Garhshankar has now a population of 261,468 or 2,673 less than in 1891. The heaviest decrease is in the Bet.

off is very marked and the Rakar has also decreased

Tahsil Una has a population of 225,198 or 4,110 less than in 1891, distributed as in the margin.

53. Gurdaspur District.-The District population has decreased from 943,922 in 1891 to 949,334 in 1901, i.e., by 3,588 or '37 per cent. Females have, however, hardly decreased at all, males being 3,478 fewer than in 1891. The District has contributed 43,593 settlers to the Chenab Colony, but its percentage (89°c) of District-born to total population remained practically the same as in 1891, the numbers having decreased from 848,202 to 845,686.

Tahsil Gurdaspur .- The population has risen from 252,092 in 1891 to 258,379 in 1901, an increase of 6,287, cr 2'5 per cent., males 2,870 and females 3,417.

Tahsil Batala,-The Tahsil population has risen from 300,644 to 305,867 or by 1.7 per cent. only, but as the town of Batala (27,365) has only a nominal increase of 142 souls the increase in the remaining areas is 5,081, or 1'8 per cent., of whom 2,119 are males and 2,962 females.

Tahsil Pathankot .- The population of this Tahsil is now 141,623 or only 773 more than in 1891, and in the rural area there has been an actual decrease of 2,443 souls.

Tahsil Shakargarh.-The population of this Tahsil has fallen from 250,336 to 234,465 a decrease of 15,871-of whom over two-fifths are femalesequivalent to a decrease of 6.3 per cent. In 1881, however, the population of this Tahsil was only 219,511 and it is therefore 6.8 per cent. higher now than it was in that year.

54. Sialkot District.-The population is now 1,083,909 as against 1,119,847, a decrease of 35,938 or over 3 per cent. but the Chenab Colony has absorbed 103,390 of its population, so that by putting back the colonists the population of this District may be said to have really increased by 67,452, or 6'02 per cent. That the decrease is really due to emigration might also have been inferred from the fact that, while the males have decreased by 25,156, the females are only 10,782 less than in 1891.

The District-born population has fallen from 1,035,425 to 992,743, being thus 42,682 less than in 1891, or by 4'I per cent. As might have been anticipated the District-born shows a greater decrease than the whole population, the former having contributed largely to the Chenab Colony.

Malarial fever, prevalent in 1892 and 1900, was not conspicuously fatal in any particular tract and the decrease in the population is general.

Tahsil Sialkot.—The population has increased from 302,866 in 1891 to 312,688 in 1901, and as the town of Sialkot only shows an increase of 2,869 the rural population has increased by 6,953, being now 254,732, or by 2'8 per cent.

The births recorded (409,066) exceed the deaths by 58,908.

⁺ The births returned exceeded the deaths registered by 190,756 during the decade. The "District-bora," however, have decreased by 43,658, so that 173,438 persons have to be accounted for. The Colony accounts for a53,500, and some 70,000 must have emigrated elementer.

Tahsil Pasrur.—In this Tahsil the population has decreased from 203,875 in 1891 to 193,746 in 1901. The decrease in the past decade thus amounts to 10,129, or nearly 5 per cent. of whom two-fifths are females.

Tahsil Raya.—The population has decreased from 214,671 in 1891 to 192,440, or by 22,231, equal to 10'3 per cent. but the males have decreased by 12,930 and the females by only 9,301.

Tahsil Zafarwal.—The population has fallen from 190,970 in 1891 to 178,887, or 63 per cent. Males have decreased by 6,923, females by 5,160.

Tahsil Daska.—The population, now 206,148, is only 1,317 less than in 1891, and the number of females shows a slight increase.

55. Gujrat District.—The population of Gujrat is now 750,548 souls, or 10,327 less than in 1891, a decrease of 1.35 per cent. The decrease is practically confined to the two Tahsils of Phalian and Kharian, and the fact that in the District as a whole the number of females has actually increased by 785 points to emigration as the cause of the decrease.

During the past decade 84,246 more births than deaths were registered, yet the District-born population has fallen from 720,251 to 70,4905, a decrease of 15,346 or 2'13 per cent. There are thus about 100,000 persons to be accounted for unless we assume that the enumeration was incomplete, or that births have been often registered twice, or that deaths have not been completely registered. None of thece assumptions are justified. The present census was most carefully supervised by the Deputy Commissioner (Captain A. C. Elliott) and imperfect registration would be likely to show fewer births, as well as fewer deaths, than actually occurred.

The District has supplied 25,352 settlers to the Chenab Colony and there has been considerable emigration to Gujranwala (34,548 as against 8,750 in 1891), but the numbers enumerated in Shahpur hardly equal the figure of 1891 (9,310 as against 8,424), so that the Jhelum Canal has not yet attracted many settlers or labourers to the latter District. The emigration would thus appear to have been to countries beyond India, as noted in the District report, but that emigration can hardly have been on so extensive a scale as to account for the deficiency which still remains.

Tahsil Gujrat.—The Tahsil has now a population of 309,887, or 1,026 more than in 1891, but the town of Gujrat has increased its population by 1,360 souls, so that in the rural areas there has been a slight decrease. This is chiefly due to the decrease in the Hithar Circle, and the Deputy Commissioner says:—

"In this Tahsil the best cultivated lands are in Jatatar and Hithar, but there is very little room for further extension, and emigration to a certain extent is necessary. The Bulandi or sub-montant tract is not densely populated and as, with the exception of one or two harvests, the crops there have been good even in the scarcity period of 1895-98, people have not left their homes and so we find there an increase equal to 9 per cent of the population of 1891. Jatatar shows an increase of only 4½ per cent. owing to emigration. Hithar, which though congested is not worse off than Jatatar, shows a decrease of 12,944, or about 17 per cent. The set of the Chenab river for the past decade has been unfavourable to this District. Consequently some villages have lost their lands and the people have gone to the other tracts. Some Bahrupias, whose lands were acquired for the Khanki headworks, have been given lands in the Chenab Colony. The decrease therefore in the Hithar of Gujrat is due partly to river action and partly to emigration due to want of room for the increased population."

Tahsil Kharian.—The population has fallen from 248,076 in 1891 to 242,687 in 1901, a decrease of 5,389 or 2'17 per cent., but the female population has increased by 1,602, males having decreased by 6,991. The District report notes:—

"There is increase both in the Jhelum Bet and Pabbi circles, but the Maira shows a decrease of 7,610, or about 4 per cent. It must be remembered, however, that the Maira of Kharian is a large tract consisting of no less than 399 villages. It may be divided roughly into two parts; the eastern, which gets more rain and where crops are not so uncertain, has not decreased in population, but the western half, where the rainfall is often precarious, has suffered severely from drought and the emigration has been extensive. It is from this part that a number of people, several thousands in fact, have gone to Africa. The tract, however, is not irrigated and, therefore, emigration in time of scarcity is a most desirable thing."

Tahsil Phalian.—The population is now 197,974, having decreased by 5,964 or 2'9 per cent. since 1891 and the female population has decreased far 64

more than the male, being 4,246 less than in 1891 as against a decrease of 1,718 males. The Deputy Commissioner notes:—

"In Phalian the Jhelum Bet shows an increase of 12,329 or over 50 per cent, on the 1891 population. The increase here is, however, not real. The Jhelum Canal head works account for 6,170 souls and the population of the Central Jail there was 2,220 (and numbers of labourers in the Canal were enumerated in the neighbouring villages). If these two items are deducted, the net increase is 3,390 or 17 per cent. Both the Bar and Hithar of Phalian show a decrease of 9 and 16 per cent, respectively. The Hithar depends almost entirely on wells, and these cannot be worked unless there be fodder and tenants. This tract has suffered most from the proximity of the Chenab Colony."

Both tenants and landowners had emigrated in considerable numbers, finding it more profitable to take up land there, but the Bar had also suffered from scarcity, more or less, since 1895 and this accentuated the movement to the Colony.

56. Jhelum District.—The District has now a population of 594,018, as against 609,056 in 1891, a decrease of 15,038, or 2'5 per cent. But while males have decreased by 17,410, females have increased by 2,372. The District-born population has decreased from 569,679 in 1891 to 559,803 or by 9,876* (less than 2 per cent).

Tahsil Jhelum.—The total population has decreased by 6,068, being now 170,078 as against 177,046 in 1891, and the urban having increased by 2,073 the decrease in the rural areas amounts to 8,141 or nearly 5 per cent., but females have increased by nearly 500. The Revenue Assistant notes that the Pabbi and Khuddar Circles show decreases owing to two successive bad harvests in the three years preceding the Census, which caused emigration to better grazing country. The River and Maidan Circles show increases, but not sufficient to make up the deficiency in the two former. The riverain villages are not affected by malaria and those near Jhelum itself support numerous milch cattle.

Tahsil Talagang.—The population, now 92,594, has decreased by 2,372 or 2:5 per cent. since 1891, and the females have decreased (by 810), though only half as much as the males. Most of the villages in the north and west of the Tahsil show increases: those in the south and east decreases. The bad harvests of the past three years have caused emigration to the Chenab Colony and to the Punch territory in Kashmirt.

Tahsil Chakwal.—The population now stands at 160,316, or 3,745 less than in 1891, but females have increased by 703. The same causes are assigned as in the other Tahsils. There is some temporary emigration in the cold weather, with camels for carrying the trade or work in the indigo factories in Multan.

Tahsil Pind Dadan Khan.—The Tahsil population, now 170,130, has fallen by 2,853, but the town of Pind Dadan Khan accounts for 1,285 or nearly half the decrease. In rural circles there is an increase of 1,107 females and a decrease of 2,675 males, giving a net decrease of 1,568. The Jalap ilaqa has a generally increased population owing to its vicinity to the river and the abundance of wells. The Vanhar, Thal and Phaphra Circles show decreases, due to emigration, caused by scarcity among the poorer classes, towards the Chenab Cclony. The Revenue Assistant's note continues:—

"The railway line that was opened in 1886 drew away the traders to other centres of trade. The boatmen have gone off to other work, as boat traffic along the river has fallen off a good deal. Powerly has been the main cause of decrease of population. There were very few marriages during the last decade. There have been a great number of marriages within the last few months after the good rabi of 1901 and there were very few during the few years preceding this last rabi."

57. Rawalpindi District.—The population of this District—including the Tahsil of Attock—is now 930,535 as against 887,194 in 1891, an increase of 4'8 per cent.

The District did not suffer from actual famine, but in 1896-07 and again in 1899-1900 there was scarcity in Tahsils Gujar Khan, Pindigheb, Fateh Jang and the western parts of Rawalpindi, the want of fodder being most severely felt. The

The births returned in 1891-1900 exceeded the deaths by 30.729.
 These figures take no account of the two villages transferred by Punjab Government Notification No. 781, dated 27th August 1900.

rural population has also been affected to some extent by the decline of village industries and the District report remarks:—

"The weavers, oilmen, blacksmiths, etc., have suffered owing to the import of English piece-goods and other articles, also by flour mills and other machines having been established here."

Tahsil Rawalpindi.—In this Tahsil the rural population has risen from 169,346 in 1891 to 173,413 in 1901, or by nearly 2'4 per cent.

Tahsil Gujar Khan.—The population has fallen from 152,455 to 150,566, a decrease of 1,889 or over 1 per cent., but the number of females shows an increase of 1,864, males having decreased by 3,753.

Tahsil Attock.—Attock has now a population of 150,550 or 9,487 (nearly 7 per cent.) more than in 1891, the Settlement Collector, Hazara, notes:—

"In this Tahsil, and especially in the Sarwala iláqá, the people have been harder hit by years of deficient rainfall and scarcity than in the rest of the (Hazara) District, but exceptional circumstances, such as openings for work on the new Mari-Attock railway, have helped them to tide over bad seasons without much difficulty."

The increase in the rural population of the Tahsil is also close on 5 per cent. Tahsil Kahuta.—The population, 92,372 in 1891, is now 94,729, an increase of only 2'5 per cent.

Tahsil Murree.—This small Tahsil shows a marked increase of 14 per cent., having now a population of 52,303.

Tahsil Pindigheb.—The population has risen from 99,350 in 1891 to 164,37 or over 7 per cent., but of the added numbers (7,087) 4,110 are males and only 2,977 females.

Tahsil Fateh Jang.—The population, 113,041 in 1891, is now 114,849, an increase of only 1,808.

The only assessment circle in this Tahsil, and indeed in the District, which shows an actual decrease is that of Sil Sawán in which the population has allen from 54,823 to 53,894, a decrease of less than 1,000. The Revenue Extra Assistant Commissioner (Munshi Jftikhar-ud-din) writes:—

"This circle is a low-lying tract no doubt, but the reason of the decrease does not seem to be only its bad climate. The inhabitants are small land-owners who left their homes owing to want of grain and grazing, which they could not get here in the time of drought, and had not come back yet when the census was taken."

58. Hazara District.—The population of the District has risen from 516,288 to 560,288, an increase of 44,000 or 8.52 per cent.

				POPULA		
	Tal	asil.		1901.	1891.	Percentge of increase or decrease.
Abbottabad				194,632	175,735	+ 10.42
Haripur	***	•••		151,638	142,856	+ 6.14
Mansehra	•••	•••		182,396	165,312	+ 10.33
Amb	•••	•••		24,956	26,290	- 5'07
Phulra				6,666	6,095	+ 9'36

The figures above show the variations in each Tahsil. In Abbottabad Tahsil the town and cantonment show a decrease and thus the remaining population, now 186,868, has increased by 21,296 or 128 per cent. since 1891. The rate of increase is lowest in Haripur, the most highly cultivated portion of the District, as the Settlement Collector points out. He adds:—

"In the feudal territories, Cis-Indus Amb shows a decrease of 5 per cent, while Phulra shows a rise of 9 per cent. No reason can be given for the decrease in the former State, but the present census is probably much more accurate than the last."

The Settlement Collector thinks that the extension of cultivation has almost reached its limit and that this accounts for the diminished rate of increase which was more than double in the 1881-1891 decade.

The District-born population has, however, risen from 487,396 to 539,468 or over 10 per cent.

NORTH-WEST DAY AREA

The Punjab Districts.- In discussing the local fluctuations of population in these Districts it will be best to first describe the Chenab Colony and then to deal with the Districts of Gujranwala, Jhang and Montgomery out of which the Colony has been formed.

59. The Chenab Colony.-The Chenab Colony returns already a population of 791,861, of whom 453,861 are males, there being only 745 females to every 1,000 males, as yet, because the earlier settlers have only now begun to bring their families into the

immigrants are given in the margin. It will be seen that Sialkot has sent over 100,000, no other District approaching this number. Amritsar comes next with nearly 68,000 and Jullundur with close on 57,000.

Colony. The Districts which contributed

Tabsil. Po	pulation, 1901.	Tabsil. I	Popula	tion, 1901.
Khangah Dogran	133,780	Toba Tek Sin	gh	125,684
Lyallpur	263.541	Jhang (Colony)	28,548
Samundri	157,285	Chiniot	***	83,023

The Colony is made up of six Tahsils which with their present populations are noted in the margin.

These Tahsils were thus constituted:—Tahsil Khangah Dogran almost entirely consists of the southern part of the Tahsil of Hafizabad in the District of Gujranwala, with a few villages of Tahsils Chiniot (in Jhang) and Gugera:• (in Montgomery) the Lyallpur Tahsil consists of parts of the former Tahsils of Chiniot and Jhang: †, Tahsil Samundri was carved out of the Tahsils of Lyallpur and Jhang: ‡, and Tahsil Toba Tek Singh out of Tahsils Lyallpur, Jhang and Shorkot, also in the Jhang District.

The remaining two Tahsils in the Colony are portions of the old Tahsils (Jhang and Chiniot) of the Jhang District.

The population of each fragment of the three Districts which contributed to the area of the Colony has been ascertained as accurately as possible, but the uncertainty of boundaries in the wastes of the Bar renders it impossible to say that absolute accuracy was attained. It was not found difficult to note, roughly, the name of the old District in which each new abadi was situated, but it is not impossible that the old boundary lines

District.		Population of part in the Chenab Colony.	Born in Dis- trict,

run right through the sites of existing villages, founded since the Chenab Canal was opened. Approximately | then the marginal figures show the population of the portion of each District included in the Colony, and the numbers which each District contributed to

the Colony (out of its own District-born population), but we have no figures

Punjsh Government Notification No. 684, dated 22nd August 1893.
 Do. do. do. No. 442, dated 11th June 1896.
 Do. do. do. No. 413, dated 21d May 1900.
 Do. do. do. No. 414 of same date.

These Notifications involved various minor changes in the boundaries of the districts concerned.

⁴ These remarks will explain why no attempt was made to obtain data showing the immigrants late the Golony from the parts of Gignawaia, etc., which lie outside its limits. To obtain these data we should have had terected (ii) the District of birth and (iii) to ak if a man born in Gignawaia was born in the part of Gignawaia, outside the Colony or inside it. This would have been confusing to a degree and with uncertain boundaries it would have been salests.

showing how many of the 168,090 persons born in Jhang were born in that part of the District which lies in the Colony and how many were immigrants into it from the other part.

60. Gujranwala District.—The population of the District excluding the annder colonization in the Chenab Colony has increased from 619,815 in 1891 to 755,797 or by 136,982, equal to 22'1 per cent.

Tahsil Gujranwala.—This Tahsil has now a population of 252,863 as against 269,166 in 1891, a decrease of 16,303, but the population in the towns having increased by 2,954 souls, that in the rural areas alone shows a decrease of 19,257 or 82 per cent. Males have, however, decreased more than females, in the ratio of 11 to 7. The decrease is attributed, probably correctly, to emigration on a large scale to the Chenab Colony. The Bar and Bangar Circles show a large decrease, while the population of the Charakhri is slightly higher than in 1801.

Tahsil Wazirabad.—The Tahsil population is now 183,205 or 401 less than in 1891, but in the rural area which has a population of 148,004 the decrease is 8,962 or 5'7 per cent. and the females returned are 174 less than in 1891. In that year, however, nearly 9,000 labourers employed on the Chenab Canal were enumerated in this Tahsil and thus there has really been no decrease in its population.

Tahsil Hafizabad.—Excluding Tahsil Khangah Dogran, there is an increase of 49,623, chiefly in the Bar villages which account for two-thirds of the increase. But over 100 villages in the Chenab and Bangar show decreased populations amounting in all to some 7,500 persons, attributed chiefly to emigration to the canal-irrigated tracts. In Tahsil Khangah Dogran 47 old villages (not irrigated) have lost 4,536 souls owing to the same cause.

61. Jhang District.—All three Tahsils have contributed areas to the Chenab Colony and thus comparison of the present returns with those of 1891 is impossible, but it is noted that four of the six riverain assessment circles show a decrease of population ranging from 2 per cent. in Jhang to 19 per cent. in Chiniot Tahsils. The drought of the past few years has driven population to the Colony, because the Canal is accessible. In Shorkot Tahsil where it is not so accessible the population has migrated to the two riverain circles which show increases of 5 and 7 per cent, respectively.

62. Montgomery District.—In spite of the colonisation of a small part of the Gugera Tahsil this District shows a decrease in population of 1,815 souls since 1891, and excluding that part the decrease is general in all three Tahsils.

Montgomery Tahsil.—The decrease in this Tahsil amounts to 17,075 or 18 per cent. on the population of 1891, and females have decreased by 7,722.

Tahsil Dipalpur.—This Tahsil shows a nominal decrease of 720 souls, entirely due to a decreased number of males.

Tahsil Gugera.—The part not transferred to the Colony shows a heavy decrease. As in the Montgomery Tahsil there has been considerable migration to the Colony due to continuous drought.

63. Shahpur.—The District has now a population of \$1524,259\$ as against 493,588, an increase of 30,671 (or 6 per cent.), more than half of whom are females. Its District-born population has risen from 456,910 to 479,674 or by 5 per cent. only. In Tahsil Shahpur the population has increased from 146,376 to 167,905, or by nearly 15 per cent. due to the extension of canals, both State and private, which has caused an influx of population. On the other hand, Tahsil Bhera shows a decrease. This Tahsil has now a population of 194,469 or 1,116 less than in 1891, and Bhera town shows an increase of 1,252 souls, and Miani of 71, so that in the rural areas the population has fallen by 2,439 or nearly 1:42 per cent.

The Chenab Assessment Circle has now a population of 56,621 as against 69,281 in 1891, a decrease of 12,660 souls or 18'3 per cent. This is attributed to scarcity; numbers of people have emigrated to the Chenab Colony in search of employment. The decrease in the Tahsil is almost confined to the male population.

Tahsils are given in the margin. The Deputy Commission of Bannu explains that the increase in Mianwali is due, in spite of hard times, to the

The natural

division of the two south-

Railway.

In Tahsil Khushab the population has risen from 151,627 to 161,885, an increase of 6.8 per cent.

64. Mianwali District.—This District has a population of 424,588, an increase of 6 per cent. on the population of the four Tahsils, which now constitute it,

	Tahs	il.		Population, 1901.	Percentage of increase since 1891.

ern Tahsils of the District is into the Kachchhi or Indus Valley tract and the Thal or sandy waste east of the Indus, and the Settlement Collector, Dera Ismail Khan, remarks that:—
the Thal in both Tahsils has suffered and probably permanently, and there is a great number of deserted wells. A number of the poorer zamindars in the North-Western Thal have found their way to the Jhelum Canal and elsewhere.

65. Multan District.-The population of the District has risen from

Tabsil-				Population, 1901.	Increase per cent. since 1891.

f the District has risen from 635,726 to 710,626, or by nearly 12 per cent. since 1891, but the increase has not been evenly distributed as the marginal figures show. The only tracts in the District which show an actual decrease are the Hithar, Ravi and Utar circles in Kabirwala Tahsil, due to emigration of tenants to better irrigated tracts in the

District or in Bahawalpur.

66. Bahawalpur State.—This State shows an increased population of 70,835 souls, or over 10 per cent. more than in 1891. Its population has risen from 573,494 in 1881 to 720,877 in 1901, or by nearly 26 per cent. in 20 years. This expansion is due to the development of its canal system.

67. Muzaffargarh.—The District shows an increase of 24,561 or 6'4 per cent., having now a population of 405,656 as against 381,095 in 1891. The District-born population has however risen by 27,277 or 8 per cent. The marginal figures

	Т	absil.		Population, 1901.	Increase per cent. since 1891.

for Tahsils show that the increase has been fairly uniform. The only circle which shows a decrease is that of the Thal Chahi in Tahsil Sanawan and this is explained as due to migration, caused by scarcity, to the Thal Chahi-Nahri circles.

droughts of the past decade have caused the population to abandon, temporarily, the drier tracts. Thus in the Pachadh generally people have left their villages, especially those at the 'tail' of the hill torrents, for the canal-irrigated and Bet vill-

68. Dera Ghazi Khan District.—The population of this District as now constituted has risen from 427,758 in 1891 to 471,149 or by over 10 per cent, but the rate of increase in each Tahsil is by no means uniform as the figures in the margin show. It would seem that the

ages, and cessation of the floods caused by the erection of the dams, has led to emigration from the Gharkab and Kadra Assessment circles in Tahsil Rajanpur. In Tahsil Jampur excess of same

[•] The registered births exceed the deaths by 26,528 in the decade, so that the figures are in close accord.

and consequent bad crops has caused a decrease of population in certain villages of the Sindh circle.

The North-West Frontier Province.

69. Peshawar District.—This District shows, next to Hazara, a greater development of population since 1881 than any other in these Provinces, having now a population of 788,707 or 189,255 more than in 1881, on its present area an increase of 31.6 per cent. The population has risen by 76,912 or 10.8 per cent. since 1891.

The Peshawar town and cantonments only partially account for this increase, the rural population of the District having risen from \$83,266 to 649,797 or by 11'4 per cent. The increase in the rural population of the Tahsils is given in the

		Tahsil.		Rural popula- tion, 1901.	Increase per cent, since 1891.

margin. The Tahsils of Peshawar and Charsadda comprise the three Tahsils of Peshawar, Doaba Daudzai and Hashtnagar of 1891, the Doaba Tahsil having been abolished in 1893.

70. Kohat District.—The population of this District has risen from 195,148 to 217,865 or over 11 per cent. since 1891. Part of the increase is due to the presence of troops and of labourers on the Khushalgarh-Kohat Railway, now under construction, but there

	Tahsi	ı.	Rural population, 1901.	Increase per cent. since 1891.
Kohat Hangu		***	 48,839 43,901	+10.0
Teri	***	***	 94,363	+10.4

has been a substantial increase even if all these figures be excluded, as the details by Tahsils in the margin show. The rate of increase for the District in the 1881-1891 decade has thus been main-

tained, though Kohat Tehsil shows a decrease. The Settlement Collector thus describes the causes of the increase:-

"The figures in themselves do not appear to call for any particular remarks. They show a steady advance in prosperity, due no doubt in a great degree to the gradual extension of law and order along the border. The greatest increase is shown in the Kohat Tahsil which is the most settled. In the Hangu Tahsii also there has been a great improvement in security and comfort, due to the occupation of the Samana Range by our troops. On the British side of this range hamlets peopled by tribesmen from across the border, chiefly Rabia Khel Orakzai, are also springing up and now contain 1,445 inhabit-ants. The figures for the Teri Tahsii are probably more correct than those of 1891 at which time there was no regular revenue establishment in the Khattak part of the Tahsii."

- 71. Bannu District.—The District, as now constituted, returns a population of 231,485, an increase of 27,016 persons or over 13 per cent. Both its Tahsils show an increase. In Bannu Tahsil the population has risen from 120,324 in 1891 to 130,444, an addition of 10,120 or 8 per cent. but, excluding the town and cantonment the population has only risen from 111,507 to 116,153 or only 4 per cent. The population of Tahsil Marwat, 84,145 in 1891, is now 96,332, an increase of 14.5 per cent. That these increases are, for the most part, due to greater prosperity would appear from the District report which says:— 'It is believed that irrigation facilities in Bannu and their extension to parts of Marwat have contributed to the increase in population.' It is however added that an influx of people, from other Districts, owing to famine, accounts in part for the increased population.
- 72. Dera Ismail Khan District.—The District has now a population of 252,379 as against 229,804 in 1891, an increase of 22,575 persons, or nearly 10 per cent. In Tahsil Dera Ismail Khan the total population has risen from 133,809 in 1891 to 144,337 in 1901, but the rural population has only risen from 106,925 to 112,600, an increase of 5,675 persons or 5'3 per cent. The other

The births only exceeded the deaths registered by 18,267, in 1891-1900 in the old District of Bannu, which included Mianwali and Isa Khei Tabsils.

Tahsil	Population, 1901.	Increase per cent since 1891.
PD 1	55,053 48,467	5'3 10 8

Tahsils also show increases as the figures in the margin (from which the population of Wano, 4,522 males, is excluded) show. The Settlement Collector writes:—"I would point out that the Tah-

sils of this District are purely arbitrary divisions. The real division of the District is into the Daman or lands between the foothills and the Indus, and the Indus Valley or Kachchhi, both tracts lying in Tahsils Dera and Kulachi, and the constant fluctuations in the population of these tracts is not sufficiently marked in the Census returns by Tahsils. Thus at present the Daman has furnished, both in Dera and Kulachi, a large number of settlers to the Kachchhi."

And a scrutiny of the village statistics bears out this account, the Daman villages which are dependent on the rainfall often showing decreased populations.

73. The movement of the population in the decade, 1891-1901.

The general conclusions to be drawn from a consideration of the figures given in the above paragraphs would seem to be that famine or scarcity has not been by any means the sole or even the chief factor in the movement of the population. No doubt from all the dry areas, in which cultivation depends entirely on rainfall and which are unprotected by wells or canals, there has been extensive emigration to more fertile tracts. Thus in the Districts of the south-east Punjab the movement has been towards the fertile Districts of Gurgaon and Delhi, or in the cases of Rohtak, Karnal, and especially Hissar to the canal-irrigated tracts within the District. The other Districts and the larger States of the Indo-Gangetic Plain West show, as a whole, satisfactory increases of population, though there have been certain local fluctuations. Seeing that in the famines of 1897 and 1900 the scarcity of fodder was a serious factor, one would have expected that the population would have shown a large, if temporary, increase in the Himalayan and Sub-Himalayan areas in which grazing is plentiful and to which, according to general observation, cattle were taken in great numbers. This, however, is not the case. Excepting Nahan State none of the Himalayan tracts show much increase of population and that of Kangra is practically at a stand-still, while all the Sub-Himalayan Districts except Rawalpindi and Hazara have decreased. This decrease is to be ascribed in part to the emigration to the Chenab Colony, and if we 'put back' the numbers born in the Districts

District			excluding Emigrants to ti	including he Chenab
	***		-5'5	-4.2

***	***		-1.3	+2
***	***	***	-24	-1.8
	***	***		Emigrants to t Emigrants to t

which have contributed most to the numbers enumerated in the Colony we find that the decrease gives place to an increase in four out of the six Districts in question. But in only one instance, visa, Sialkot, is the rate of increase even then near the normal rate, or the rate of

the Punjab as a whole, in these Sub-Himalayan Districts.

The figures for Ambala will be noticed in paragraph 75 below, and those for Sialkot, which shows a normal increase, need not be discussed further.

Loss by emigra-tion in Punjab Excess over District. (excluding the Chenab Colony) 18,1 Hoshiarpur 9641 65,373 Gurdasp Sialkot 32,021 79 581 51,420 4.635 1,407 26.534 ... Gujrat Ihelum 45.027 31,385

The remaining four Districts show a considerable volume of emigration, even if we exclude the exodus to the Chenab Colony, and the figures are, in the cases of Gujrat and Jhelum greatly in excess of the 1891 data. Only then in the case of

Hoshiarpur does the population, making every possible allowance for increased emigration, show an unsatisfactory rate of increase. In Gurdaspur the average is lowered by the decrease in Tahsil Shakargarh.

In the North-West Dry Area the decade has been one of expansion. Except Montgomery all the Districts show considerable increases, usually above

The births returned in the old District which included Bhakkar and Leiah Tahsils in 1891-1900 exceeded the deaths by 18,303 only.

the Provincial average. Shahpur which shows an increase of 6'2 per cent. would have increased 9'5 per cent, but for emigration to the Colony. Mianwali and Muzaffargarh have the smallest increases, and even they have added 6 to

6.4 per cent. to their population.

74. The effect of the famines on the population.—The remarks in the foregoing paragraph will have shown that it is not in the famine-stricken Districts that a decreased population will be found. Of the Districts affected in 1897 or 1900, Hissar has a stationary population, Rohtak and Gurgaon have increased, the first by 6.8 per cent., which is nearly the rate of the Punjab generally, and Gurgaon by 11.5 per cent., which is very much above that rate. The increase in Karnal is only 2.6 per cent, but scarcity does not account for the smallness of the increase. However much scarcity and consequent high prices may have affected the poorer classes in the richer Districts, emigration to the Colony accounts entirely for their not showing an increase equal to that of the Punjab as

	District.			Rate of increase includ- ing emigrants to the Chenab Colony.

Amritsar	***	***	***	10.

a whole, as the marginal figures demonstrate. Famine cannot be assigned as the cause of the stagnation in Kangra or the slow advance of the Himalayan States, and it is exceedingly doubtful if scarcity has had any noticeable effect on the

population of the Sub-Himalayan Districts. The maps opposite page 51 illustrate

the variations in density since 1891 and 1881.

It would, however, be going too far to say that in no part of the Punjab has famine affected the population. Taking the figures for Tahsils it will be seen that those coloured blue on the map on the opposite page have a decreased population, and in the case of Tahsils Sirsa and Bhiwani (in the Hissar District), Sharakpur (in Lahore), Shakargarh (in Gurdaspur), and possibly Gujar Khan (in Rawalpindi), the decrease may safely be attributed to famine, but to what extent the decrease is real, or how far it merely represents emigration to more favoured tracts, we cannot say. That the decrease is more or less permanent in character will be apparent

Subsidiary Table VII. Columns 3 and 7.

from a comparison of the

rates of decrease in the female population which are almost the same as those for the rural population.

75. The effects of malaria.—The condition of the population in the Karnal District is not satisfactory and its continued decline in Thanesar Tahsil claims attention. It would seem that this decadence of the population is also found throughout the five Tahsils of Ambala, alike in the drier areas of Tahsils Ambala, Jagadhri and Naraingarh, and in the fertile Tahsils of Kharar and Rupar. Thence the decrease in population is continued into the sub-montane Tahsil of Samrala, the Bet of Tahsil Ludhiana and into Zira and Ferozepur Tahsils. The five Tahsils from Rupar to Ferozepur lie on the south bank of the Sutlej, and for the most part to the north of the Sirhind Canal.

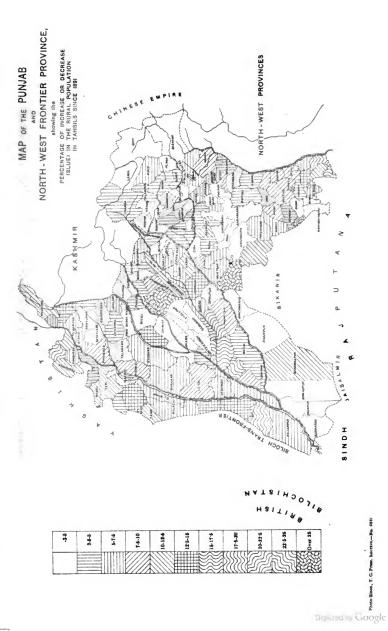

Increased emigration from these tracts cannot be assigned as the cause of the decrease, and reading the District reports with the Census figures it is hardly possible not to conclude Paragraphs 34, 51, 37, and 39, 10/pra.

that the population has actually diminished.

The causes of this diminution are not easy to fathom. The Ferozepur authorities assume that, as a matter of course (vide paragraph 39 above), the miscellaneous Mohammadan does not increase so fast as a (Hindu and Sikh) Jat population does. The grounds for this assumption are not stated, and the Mohammadans in these Provinces show, generally, a far greater rate of increase than the Hindus and Sikhs combined. The tracts under discussion are, I believe, notoriously unhealthy as a whole, and it would certainly appear that malaria has, on the south bank of the Sutlej and in the sub-montane between that river and the Jumna, sapped the vitality of the population. An extreme instance of this is afforded by the unhealthy Naili circles, in which the age-constitution of the population is significant. To this point I shall return in the first part of Chapter IV.

Turning northwards we have Hoshiarpur, with its slowly increasing population, and Kangra in which the population is nearly stationary. Possibly this condition of things is in part due to the same cause, but the areas affected are

small and the figures in consequence are not conclusive.

PART III-MIGRATION.

Paragraph 134. Panjab 76. Types of migration.—" Migration," says Mr. lbbet-son, " may be roughly referred to four different types:—

- "I. Temporary, due to a local failure of grass, or even of food, driving the people to seek the one or the other in more favoured Districts; to a temporary demand for labour on public works, or for transport purposes, attracting a large number of labourers to a particular locality, and the like.
- "II. Periodic, due to the changing seasons which drive men to and fro between the cool mountains and the warm valleys and plains, or from the scorched up steppes to the grassy river banka and lower hills and which send them forth for purposes of carriage, trade, and so forth.
- "III. Permanent, where overcrowding or distress on the one hand, or physical or political advantages on the other, drive away from one District and attract to another people who settle down permanently on the land.
- "IV. Reciprocal, where, in the absence of any local attractions to induce movements from either quarter, persons pass from one District to another, and are replaced by others moving in the opposite direction. This form is largely peculiar to the east of the Province, and will presently be discussed.

These four types can, in great measure, be distinguished by the varying proportion of the sexes among the migrants, the males being largely in excess in temporary and less so as a rule in periodic migration, the proportion being fairly normal in permanent migration, while in reciprocal migration the females greatly predominate. But of course each type shades off into all the others; indeed it may often be said to produce them, for people will more readily settle temporarily or permanently where friends and connections have preceded them; two or more types are generally present side by side; and the proportion of the sexes can only be taken as a very rough indication of the general nature of the migration, and of the type which prevails most largely."

To these may be added a fifth type, found chiefly in the South-East of the Province, but not confined to it.

There is a rule, and apparently a stringent rule, among the Rajputs in Gurgaon that a daughter must always be given in marriage to the West, and a wife taken from the East. Thus the Rajputs of Rewari get wives from Ujina, Sangel, and Hattin on the eastern side of the District but do not give daughters to those in the eastern tracts. This custom is said to be an imitation of that followed in the portion of Rajputana which lies west of the Gurgaon District, and it appears to have been followed for many generations.

followed in the portion of Rajputana which lies west of the Gurgaon District, and it appears to have been followed for many generations.

The Khatris of Delhi (the "Dilwala" Khatris) have a similar custom. They take wives from the Khatris of the North-West Provinces, who are termed "Purbia," but take a pride in giving their daughters to the Khatris of the Punjab proper who are designated "Lahoria" and "Sirhindia." I am unable to say how far the rule is observed, nor can I explain it. It may be, possibly, that some idea of misfortune attaches to the East—as cattle-plague must always

be cast out to the east-ward, at least in that part of the Province.

On the other hand the highest Gujar septs or families in Karnal will only marry their daughters east of the Jumna, because the other Gujars in that District sell their daughters. Amongst the Jats there is a strong objection to giving daughters to inhabitants of the poorer tracts where women have to work in the fields, as for instance in the Bangar or Jangal-des (in Karnal), and thus girls are only given to villages in the Khadir.

In Kapurthala the Jats of the Beas Bet give daughters to those of the Manjha in Amritsar west of the Beas river, and in the Riar-ki or Riar Jat tract round Batala and Kadian in Gurdaspur, while they obtain wives in the Dina and Sarwal tracts. The same is the case with the Sultanpur Jats, and to some

extent with those of Phagwara.

In the sub-montane tracts of Gurdaspur and Sialkot it appears to be a common practice for Rajputs of inferior status to obtain wives from the Thakkars

of the lower ranges.

This form of migration may, for want of a better term, be called "onesided." It is the reverse of reciprocal. The rule which compels the marriage of a daughter to a resident of a particular tract is no doubt a form of hypergamy, the law which obliges a daughter to be married to a man of higher caste, or of higher grade within the caste, than her own caste or grade. This law does not, however, explain the custom which prohibits her marriage to the eastward. But whatever the explanations may be, and whetever term we apply, there are distinct customs which cause women to be given in marriage to, but not taken in marriage from, the people of certain tracts, and the migration caused by those customs is of a distinct type. It accounts in part for the differences in the figures for migration by sexes.

77. The statistics of migration.—Our statistics of migrants are based on the return of Birth-place, Imperial Table XI, and as the rule was to record in the enumeration only the District (or State) of birth, without, as a rule, further details, we are somewhat fettered in dealing with the figures for Districts in which changes of area have occurred. This can best be made clear by taking actual examples.

The Mianwali District was not in existence, under that name, in March 1901. It was not therefore returned as a District of birth, and in consequence we cannot give any figures of emigration from that District.

The transfer of Attock Tahsil from Rawalpindi to Hazara, prior to the Census, prevents our comparing the emigration statistics of 1891 and 1901 for both those Districts. A man born in Attock Tahsil was returned as born in Rawalpindi, whereas in 1901 he was recorded as born in Hazara.

The transfer of Tahsil Thanesar, from Ambala to Karnal, renders it impossible to compare the migration data of 1891 and 1901 in the case of either of those two Districts, because, in addition to the ambiguity just described, and which exists in this instance also, we have no particulars of the immigration into Tahsil Thanesar in 1891, and cannot therefore compare them with the figures of 1901. In all cases then, the present emigration figures are for the Districts as constituted on March 1st 1901: comparison of the present immigration figures with those of 1891 can only be made for the Districts as constituted in that year; while precise comparison of the emigration statistics of 1901 with those of 1891 is not possible.

78. Immigration.—The figures show that less than 3 per cent of the population of these Provinces is born beyond their limits. In the Indo-Gangetic Plain there is considerable migration, especially in the Native States whose population seems to be far less stable than that of the British territory. In the North-West Dry Area the immigrants are relatively still more numerous, chiefly because of the high proportion in the Chenab Colony, Kurram and Kohat. In the Himalayan and Sub-Himalayan Areas the immigrants are few, except in the Nahan and Kalsia States, and in Ambala which has a large cantoment.

79. Immigration into the Punjab and North-West Frontier Province from other parts of India.—The immigration from Rajputana has increased

		Immigrant	5.		
	From			1901.	1891.
Rajputana				269,515	209.311

Kashmir	***	***		83,240	87,545

Punjab Census Report, 1892. Paragraph 254.

by 60,204 persons, or 20 per cent., since 1891, and now greatly exceeds that from the North-West Provinces, which has decreased by 15,084. These two territories combined furnish 502,239 out of the 627,990—or nearly five-sixths—of the total number of immigrants into these Provinces from other parts of India. The

immigration from Kashmir which had fallen from 113,657 in 1881 to 87,545 in 1891, has again decreased and is not now considerable. Compared with these countries the immigration from other parts of India is almost infinitesimal, and the only other considerable source of immigration is that from the countries beyond India on the North-West Frontier.

A few notes on the character and locality of the immigration from each of these countries are given on the next two pages.

80. Immigration from Rajputana.-The Districts and States which now

show the greatest number of immigrants from Rajputana are given in the margin, with the increase or decrease in each case since 1891. These figures show that there have been considerable fluctuations. Hissar, as is natural, shows the largest decrease, and Gurgaon a corresponding increase. The great mass of the increased immigration has, however, been into Ferozepur and Bahawalpur.

The character of this immigration as a whole and in the more import-

and in the more important Districts and States will be apparent from the marginal figures, from which it would seem that the immigration is permanent in Hissar and Ferozepur, reciprocal in Gurgaon and the Phulkian States, and periodic in Bahawalpur and Delhi. It is also apparent that, in the cases of Hissar and Ferozepur, the immigration is more permanent

tion is more permanent now than in 1891, but in the other tracts it is generally less so than before, as the number of females per 1,000 males has sensibly diminished. But, speaking generally, there has been little change in the character of the immigration which still remains of the permanent or reciprocal type. The conclusion appears to be that the influx of famine-stricken people from Bikaner and the adjacent States, which occurred in the years of scarcity, and more especially in 1897, has nearly, if not altogether, subsided. Multan, Montgomery, and the Chenab Colony show moderate numbers of Rajputana immigrants, but it would be surprising if the demand for labour on the canals in the Colony had not attracted men from the less fertile regions south of the Province.

The immigration into Bahawalpur is also, probably, of a more permanent type than the figures would indicate, considerable areas having been recently

colonised in that State.

of the Districts containing cities or large towns show considerable immigration from the North-West Provinces, but the figures of most interest are those given in the margin. The immigration into Delhi City is clearly temporary in character, a large number of males being employed in the factories, whereas in the rural areas the women greatly preponderate, as in Gurgaon, and to a less extent in Karnal. In the remaining Districts the males equal or out-number the females. As a whole the number of female immigrants from the North-West Provinces now slightly exceeds that of the males, while in 1891 the males were the more numerous by 6,000 only. The character of the migration has thus not materially changed, and the figures for Districts show remarkably little variation from those of 1891, though Karnal shows a considerable increase of 4,819 persons, nearly all females.

82. Immigration from Kashmir.—The immigration from Kashmir has somewhat altered in cha-

racter since 1881, when there had been a great influx of refugees from that State. The immigration appears now to be of a more permanent character, and the numbers returned as speaking Kashmiri would appear to show that few of the immigrants are new-comers into British Territory, the great mass of them having accourted

Punjabi or Urdu as their ordinary language.

The Districts which return most immigrants from Kashmir are given in the

			Ім	MIGRANTS.

Kashmr are given in the margin. In Lahore and Amritsar the immigration is practically confined to the cities, and the decreasing numbers returned in the latter District (2,815 as against 3,818 in 1891), show that the community of carpet-makers in the city is not recruited from Kashmir. Similarly, of the still large Kashmiri colony in Ludhiana, only 240 are returned as born

in that State. The greater part of the immigration is confined to the submontane Districts from Kangra (1,561) to Hazara, and where the immigration is considerable females greatly predominate. The figures for these Districts are very much the same as in 1891.

83. Immigration from Bombay and Sindh.—The increase is consider-

		1901.	1891.
Bombay	 	 4,368	2,394 6,298

able. The Deputy Commissioner of Amritsar notes that plague measures in Bombay and elsewhere appear to have driven people to Amritsar city, but only 298 immigrants from Bombay appear in its

returns. Probably the returns are below the mark, people who have come to the Punjab f,om Bombay not being over-anxious to proclaim the fact. The Bom-

Multan	***	***	***	715	022

bay immigrants are very scattered and are probably nearly all Parsis and other traders. The immigration into Bahawalpur is mainly from Sindh and is more or less permanent. That into Multan is clearly temporary.

84. Immigration from countries beyond the North-West Frontier.— The immigration from Yaghistan appears to have diminished almost to the

diministed aimost to the explanation is that a large number of entries of mulkighair, or foreign territory, were made in the Districts of the North-West Frontier Province, and these have been tabulated as 'Asia part unspecified,' and adding 46,221, the number so

46,221, the number so tabulated in that Province, to the figures for Afghanistan and Yaghistan we find only a small decrease of 1,865 persons, but as 11,252 of the immigrants were enumerated in Kurram, there has clearly been a considerable decrease in the immigration into the other parts of these Provinces. The mass of this immigration is into the Districts of the North-West Frontier Province, and the total figures

| Males. Females. | Females. | Females. | Females. | Females. | | Females. | Females. | Females. | Females. | Salara | S

for the immigration into them from Afghanistan, Yaghistan and 'Asia part unspecified ' are given in the margin. But the ubiquitous Pathan is found in almost every District cis-Indus also, and over

1,500 have been enumerated in the Chenab Colony. In most places this immigration is temporary in character, and though in Dera Ismail Khan the number of females nearly equals that of the males, this is due to the powerndah migration which is thus described by the Settlement Collector of that District:—

"There is in this District, in common with other western districts, a periodic migration of powindahs, mostly from the Amir's territory to the East of Ghazni. Of these a very large number move further down country either as traders or as graziers. Their women and children are left in the "kirris" or large temporary villages of blanket tents and thatched huts. These "kirris" are all situated in the Tank, Dera and Kulachi Tahsiis. Powindah "kirris" always return to the same locations, and no section would think of encamping on the site used by another. The trading parties go down country early in the autumn and return in the spring. One at least of these powindahs has been as far as Australia, and it would be interesting to know how many are acquainted with English. It is believed others have also been to the Colonies.

It appears from the following extract from the Peshawar report that the

immigration is in reality less than it was in former times :-

"There is a flow into the District from across the border on the one hand and from Hazara on the other. In the Charsadda and Mardan Tahsils the most common entries showed that the parents were born in Independent Territory, and their children in the District, while Swabi Tahsil was full of Tanaolis, and Swatis."

This shows that the immigrants are now in many cases domiciled in British

Territory and the same is also the case in Kohat where :-

"The chief immigrations to the District will probably be found among Waziris and Ghilzais who this year came down in rather larger numbers than usual to graze their flocks inside British territory. Orakzais and Afridis born across the border have also settled in hamlets under the protection of our troops and laws."

85. Migration by Caste.—It is a question of some interest, and in view of the recent famines of some practical importance, to ascertain what are the castes in these Provinces most given to migration. It might have been anticipated that scarcity would cause extensive migration among the lower classes, but the data compiled show that this

Subsidiary Table II-B.

is not altogether the case.

The Chamar is no doubt a wanderer in most Districts, but he does not, as a rule, migrate in such numbers as the Jat. The Brahman also migrates freely. No attempt has been made to work out the relative extent to which these comigrate in proportion to their numbers, but the figures show which classes constitute the bulk of the migrant population. It is further noteworthy that, while

females nearly always exceed the males, they predominate enormously in all the castes in Rohtak and Gurgaon, and, generally, amongst the Jats. The figures appear to show that all the Hindu castes marry at a distance, the lower to a less extent than the higher: while the Mohammadans, like the Sheikhs in Delhi, the Rajputs in Ferozepur, Lahore and Amritsar do not. There are, however, exceptions to this rule which probably depend on local conditions. The District Tables, which are too bulky to print here, give more detailed information. They will be printed in cases in which the Gazetteer is under revision.

86. Migration by sex .- The percentage of female immigrants to male depends on the extent to which 'reciprocal' and Subsidiary Table II-C, and first map opposite.

'one-sided' migration prevail. In consequence the percentage is highest in the south-east of the Punjab, and generally exceeds 50 per cent in the central and sub-montane Districts as far north as Jhelum. It is under 50 per cent in the Himalayan States, and lower still in the south-west of the Punjab and west of the Indus, being barely 15 per cent in Kurram. The data given are for intra-Provincial migration only. In the case of migration to or from outside these Provinces the male element usually predominates largely.

87. Emigration .- Owing to the customs of 'reciprocal' and 'one-sided migration already described, it is natural to find that most of the Districts which have a large immigrant Subsidiary Table III-A. have

also a considerable emigrant population. The ratio of emigrants in the Native States is generally higher than in the adjacent British Districts, but the small extent and scattered nature of their territories may, in some degree, explain this. According to our present figures the Sub-Himalayan is by far the most migratory of the Punjab populations, and it must be borne in mind that the figures take no account of the emigration beyond the Indian Empire.

88. Emigration to other parts of India .- We are able, for the first time, to give fairly complete Subsidiary Table III-B. data, by Districts and

States, for the emigration to other parts of India, all the other Provinces (except Burma) and all the States (except Mysore) having furnished us with tables showing the number of Punjab emigrants, from each District or State in these Provinces, enumerated in those parts of India. Burma only furnished us with the total number of emigrants from these Provinces and in consequence the District and State figures exclude the emigrants to Burma, who number 21,501, of whom 19,394 are males. The Districts which furnish most emigrants to other

parts of the Indian Empire are given in the margin, Rohtak. while Hissar, Lahore and Amritsar each send over 10,000 emigrants beyond these Pro-vinces. This emigration is chiefly to Provinces or States which are contiguous to the Punjab Dis-tricts. It is disappointing not to know the numbers

sent by each District to Burma. The Native States have but a comparatively insignificant number of emigrants in other parts of India.

89. Intra-Provincial Migration.—The figures given in Subsidiary Table V. A. appended to this Chapter, show the loss or gain to each District and State by migration within the Punjab and North-West Frontier Province; and it would not be possible to render the details of this intra-Provincial migration clearer than they are in that Table, column 4 of which also shows the net loss or gain to each District, or State, as constituted on the 1st March 1901.

The main currents of migration (excluding those to the Chenab Colony 78

which will be found in paragraph 59 supra.) are given below and are further illustrated by the second map opposite page 79 .-

90. Migration to and from the Feudatory States within the Province.-The present figures Subsidiary Table V.-B.

show that the movement

observed in 1891, of a tendency to migrate from the Native States into British Territory, has been greatly accelerated. In 1881 the tendency was in the opposite direction and the Native States, as a whole, then showed a gain of over 20,000 persons from British Territory. In 1891 the gain to the British

Panjab Census Report, 1892, paragraph 247.

Districts amounted to 6,482

Panjab Census Report, 1892, paragraph 247.

persons, and it now amounts to 41,274. But if we take males alone the balance is the other way, 3,317 males being lost to British territory; while 44,591 females are gained.

of. The States of the Indo-Gangetic Plain.—As in 1891 these three

				PERSO GAIN + OF	NS LOSS—
				1901.	1891.
Loharu				+ 3.565	+ 1,795
Dujana	***	***	***	+ 2,201	+ 866
Dujana Pataudi	***	***	***	1,580	-899

petty States have interchanged comparatively large numbers with the neighbouring British Districts: Loharu and Dujana have lost and Pataudi gained in the process, the figures in each case being much higher than in 1891. Famine doubtless accounts for the doubled loss to

Loharu, and perhaps it also accounts for the very large emigration from Dujana. Pataudi has apparently shared in the movement of the population to Gurgaon. But the population of these States is so small that very trivial causes may affect the numbers. Though females exceed the males the net gain in females to British Territory is not large.

92. Comparison of the data for migration within the Punjab and North-West Frontier Province in 1907 and

1891.—In the eastern Districts of the Punjab the effects of the continued scarcity on the movement of the population are easily perceived from the data for 1901 as compared with those of 1891. Hissar now loses substantially instead of gaining by intra-Provincial migration, and Rohtak loses twice as heavily as in 1891. The emigration from Gurgaon has, on the other hand, been checked, and the District now only loses 15,913 as against 23,634 in 1891. The gain to Delhi has nearly doubled, while Karnal shows the large balance of 31,180 immigrants. This District as constituted in 1891 only gained 7,060 souls by internal migration, but the gain is real, for if there had been any great influx into Thanesar the population of that Tahsil would not have shown a marked decrease. Ambala now loses heavily by migration—24,678 souls, excluding that to the Chenab Colony, as against 16,466 in 1891, in spite of the loss of Thanesar—and it appears certain that the emigration from the present District has been greater of recent years than it was prior to 1891. The main stream now is to Karnal; Patiala, which in 1891 gained over 10,438 persons from this District, now gaining only 2,458.

It would serve no useful purpose to discuss the figures for the rest of the Districts in detail. The Chenab Colony accounts for most of the differences between the present data and those of 1891. The chief points to notice are the

following :---

Ferozepore has gained only 54,619 souls as against 79,314 in 1891, chiefly, because of the emigration to the Colony. The Phulkian States show interesting results. Nabha has now a slight gain instead of a considerable loss: Jind loses only slightly more than in 1891: while Patiala now loses 79,698 souls by migration as against 34,525 in that year.

Lahore now gains only 61,332 souls as against 108,261 in 1891. Not only taken 28,620 of its population but the streams of migration from Gujranwala and Gujrat have been diverted to the Colony from Lahore.

Gujrat has now lost 76,772 by migration as against 24,886 in 1891, sending 25,332 to the Colony and 25,335 to the irrigated tracts of Gujranwala outside the limits of the Colony.

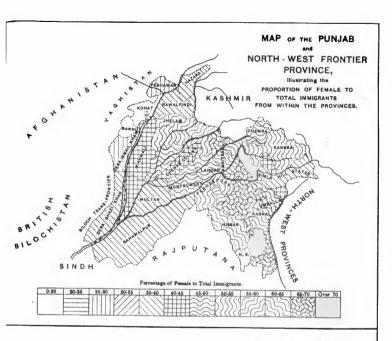

Generally speaking the District reports indicate, as do the Census returns, that the movements of the population within the Province, during the past few years, have been confined to temporary migrations in search of grazing for cattle or for employment, and none have been on a large scale.

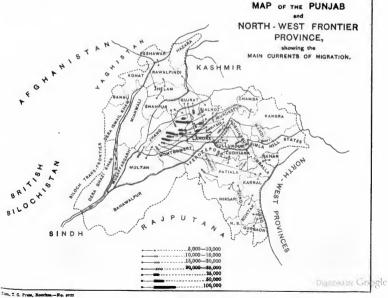

93. The balance of migration within the Indian Empire.—Taking the

two Provinces together, the 'otal number of emigrants to other parts of India, (including all the States except Mysore) amounts to 437,262 souls, whereas the immigrants number 627,990 persons, so that the two Provinces gain 190,728 Sabitidiary Table III.C. and Abstract No. 8a, page Ixxx, Punjab souls by migration in India, Census Report, 1892.

when the figures did not include the whole of Bilochistan. As we have already seen the mass of the immigration comes from the North-West Provinces and Oudh, and Rajputana, our gain from the former being just on 100,000 souls, half males, half females, while from Rajputana we gain 188,161, over 100,000 of whom are females. Migration to Kashmir leaves us only a nominal balance of 2,155 souls, while we lose 20,690 to Burmah and 16,507 to Bengal and Assam, nearly all of whom are males. On the total account the two Provinces gain 133,220 females as against 57,508 males from the rest of India, a point worth remembering in connection with the balance of the sexes.

94. Migration to and from outside India—In addition to this volume of immigration there are 167,277 immigrants from other countries outside India. In other words the total immigrant population in these two Provinces numbers 795,267 as against 740,750 in 1891, an increase of 7'4 per cent, but we have no 80

figures for the emigration to those countries. As regards the immigration from England and Afghanistan there can be but little doubt, as Mr. Maclagan said, that

Punjab Census Report, 1892, section 257.

it largely exceeds the emigration to those countries from

these Provinces, though the intimate trade connections of the commercial classes with Afghanistan, Persia, and the Central Asian markets possibly causes a good deal of emigration to these countries. But it cannot now, I think, be presumed as in 1891, that the immigration from outside India, large as it is, exceeds the emigration to outside India. The extensive emigration to Africa, Hong-Kong and the Straits Settlements, is alluded to in several of the District reports, e.g., in those of Dera Ismail Khan, Ferozepur and Gujrat, already quoted, and the Deputy Commissioner of Hoshiarpur says:—Within the last few years a large number of men from this District have also found their way to East Africa and Australia in search of work.' Again, Mr. W. S. Talbot, Settlement Collector, Ihelum, writes:—

"The increased popularity of Government Service, which provides for increasing numbers of the inhabitants of the District every year, would also account for a small deficiency: and emigration in search of employment to East Africa, and to some extent Assam and other remote regions), is a much more considerable factor of the same kind. The men who go to Africa very frequently die there: the survivors return after a few years, usually with a substantial sum of money in their pockets."

There is also a certain amount of emigration to Borneo and Sumatra. No estimate of any value can be formed of the volume of this emigration which is almost entirely temporary, being confined to men on service in the military forces and traders, but its extent may to some extent be gauged by the fact that, on the night of the Census. 1,000 labourers for Uganda were said to be collected in one sarai in the city of Lahore. On the other hand the Sialkot report says:—
'Some men have gone to serve in Africa and China, but their number is small.'

95. The effects of migration on the District totals.—I have added a common to Subsidiary Table III-B. to show the net gain or loss to each District and State by migration within the Indian Empire, so far as figures are available.

Notes.—1. The population whose birth-place was not returned has been excluded from calculation in compiling this Sub-Table. Hence the total of columns 2—7 is not always equal to 10,000.

^{2.} In column 3 'contiguous' means contiguous to the District or State concerned, and the territory so contiguous is, as a rule, apparent from the maps, but in the South-East of the Punjab the contiguous Districts and States have in certain cases been taken to be those noted below:—

			Contiguous	
District or	State.	Districts in the Punjab.	Districts in the North- West Provinces.	States in the Punjab
1		•	3	4
z, Hissar		1. Rohtak. 2. Ferozepur.	*****	1. Patiala. 2. Jind and 3 Luharu.

^{3.} In column 5 the countries contiguous to these Provinces are Afghanistan, Yaghistan and Tibet.

In the case of the Districts of Rawalpindi, Hazara, Mianwali, Dera Gazi Khan, Dera Ismail Khan and Bannu, whose areas have been changed since March 1891, and in the case of Jhang, Gujranwala and Montgomery, the figures are only approximately correct.

CHAPTER III.

RELIGION AND SECT.

1. Introductory,—It was hardly contemplated that a chapter on religions would be required in this report, and so no attempt was made to collect information on the subject. Eventually I endeavoured to obtain some notes on popular religion,—on the actual working belief of the ordinary man, but without much success. However such notes as I could obtain are given in this chapter, but no attempt has been made to embody in it the valuable notes on religion in the Census reports of 1881 and 1891. That will have to be done for the Ethnographic Survey, after our present scanty information has been largely supplemented.

The connection between popular religion and ethnology is exceedingly close, and no branch of the Survey will be more interesting and important than the enquiry into religious beliefs and the organization of the religious sects. With this explanation I pass on to a brief commentary on the figures for the several religions. Under Hinduism I shall give brief notes on the beliefs of the Hindus in the South-West of the Punjab, and in the Himalayas. Under Sikhism I add what I can to Mr. Maclagan's accounts of the sects found among the Sikhs, but I have nothing to add to his description of the Jain or Buddhist sects. Under Mohammadanism will be given a few notes, chiefly on the form of Islam found in the South-West Punjab, and lastly the Christian figures will be briefly noticed.

2. The relative progress of the several religions.—The figures show the total numbers, the ratios in every 1,000 of the population and the rates of progress since 1881, in each of the main re-

In the Tables the above order has been followed throughout. No religion has been returned or tabulated in these Provinces as Animistic, though it is not to be inferred therefrom that animistic beliefs* are not prevalent in this part of India. The numbers returned as Zoroastrians (Parsis), and Jews are too few to need further discussion. The other religions will be noticed in their proper places, but the figures for the three, numerically, most important religions may be first briefly compared.

The chief point of interest is the slow progress of the Hindu element in the past decade. The Hindus now only number 241,021 souls more than in 1891, so that, as we shall see, the Sikhs have added absolutely more to their numbers than the Hindus, but the two combined have only increased by half a million or 4'1 per cent since 1891, whereas the Mohammadans have added nearly a million and a quarter to their numbers, an increase of 9'5 per cent.

The figures for Mohammadans include the populations of the Kurram Valley, the Biloch trans-Frontier and the Shiranni country, but if we exclude them from consideration the results are much the same, for the Hindu and Sikh figures are not appreciably affected, and the Mohammadan population still shows an increase, since 1891, of over 1,140,000, or 8.8 per cent.

The chief disturbing element in the return of religions is the Chuhra. As he is, socially, outside the pale of Hinduism, Hindu enumerators have the

		CHUHRAS.		DIFFERENCE
		1901.	1891.	PER CENT.
Hindu	***	954,705	878,748	+8.6
Sikh		22,727	94.874	-76
Total	***	977,432	973,622	+4
Mohammadan	***	218,595	251,038	-10
To	tal	1,196,428	1,224,660	+1.2

greatest objection to returning him as a Hindu by religion, and so he is often either entered as a Chuhra or as a Mussalman. But the Chuhras returned or tabulated as Hindus now number 75,957 more than they did in 1891. On the other hand, the Sikh and Mohammadan Chuhras have decreased—

^{*} A definition of Animism will be found in paragraph a of Chapter VIII.

the former alone by no less than 72,147. The Hindu population then has not been diminished by conversions among the sweepers to Islam, or in an appreciable degree to Christianity.

When the figures for individual Districts and States are considered the variations are still more striking, but they will be best considered under the head of

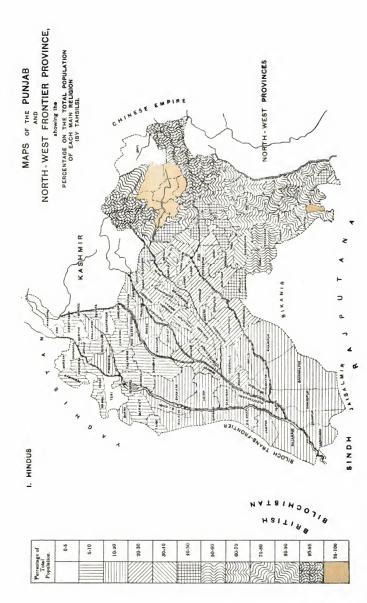

each religion.

THE INDO-ARYAN RELIGIONS.

3. Hinduism.—It is a remarkable fact that in most Districts the Hindu population has not increased during the past decade as rapidly as the total population, and that, with some conspicuous exceptions, it has been out-paced by the Mohammadan element. In Hissar the Mohammadans, in spite of the famines, have increased by '15 per cent. In Rohtak and markedly in Gurgaon they have increased by '7 per cent. In Rohtak and markedly in Gurgaon they have increased more rapidly than the Hindus, and this is also the case in Karnal and Delhi. The Mohammadans in Ambala show a relatively less decrease than the Hindus and Sikhs, and generally throughout the central Districts the Mohammadan population shows a higher rate of increase than the general population. On the other hand, in the trans-Indus Districts of Peshawar, Kohat and Bannu the Hindu element is growing more rapidly than the Mohammadan, and this is also the case in the Bahawal-pur State, but these exceptions do not help to raise the Hindu figures as a whole to their natural level.

It is difficult to suggest the causes of this stagnation of the Hindu population. It is impossible in this Province to ascribe it to the famines of the past decade, for the Mohammadan is assuredly the poorest element in the population, so that it was to be anticipated that the effects of scarcity would be more evident in its figures than in those of any other religion. To take Hissar for example: the famines as we have seen affected chiefly the Bagri Jats, who are Hindus and the Pachhadas, who are Mohammadans, and there is no reason to believe that the Hindu population in that, or in any other District, suffered more from the famines than the Mohammadan. The converse might indeed have been expected, for it is hardly possible to take up a Punjab Settlement Report without finding a lament over the short-comings of the Mohammadan as a cultivator, his lack of energy, his thriftlessness, his capacity for getting hopelessly into debt: and in the towns no part of the population felt the effects of scarcity more than the Mohammadan artizan classes of Delhi, Amritsar and Ludhiana. In view of these facts the contrast between the increasing Mohammadan population on the one hand and the almost stationary Hindu element on the other is very striking.

The causes are, I believe, to be sought in the differences in the social systems which form the material structures of the great religions. We are so accustomed to speak of Hinduism as a religion that we are apt to forget that it is much more a social than a religious system. Of that system and its results fuller details will be given in the Chapter on Caste, but broadly it may be said that it places artificial restraints on marriage, thus leading to a scarcity of women, and other attendant evils. Its Customary Law, which our law-courts have stereotyped, excludes females from succession to land, and tends to make the Punjab the land of sons only, just as the Code Napoleon has made France the country of 'le fils unique.' The Jat peasant, whether Hindu or Sikh, closely resembles the French peasant in his thrift and land-hugger, and he is hardly inferior to the Hindu of the commercial castes in the capacity for petty trading. In times of prosperity these characteristics have little or no effect on the population, but in a period of scarcity and depression of trade they begin to tell, and as competition becomes keener it may be conjectured that the Hindu population will increase but slowly, accumulating capital rapidly, while the Mohammadans will fast add to their numbers alone. Already in Amritsar and other centres of trade, manufactures are carried on by Hindu capitalists and Mohammadan artizans.

- 4. The Hindu Sects.—It is consistent with the fact that Hinduism is a social rather than a religious system that, as far as I have heard, no new Hindu sects have arisen in the past decade. Islam tends to develope the old sects and throw off new ones, but Hinduism confines its activity mainly to the semi-social movements which are guided by societies like the Arya Samaj, the Dev Dharm and others. These societies are almost entirely confined to the educated classes, and their objects are mainly, but not exclusively, social. Thus the Sat Sabha is Unitarian in creed, but non-sectarian, and encourages the study of Sanskrit, Punjabi, Hindi, and the Hindu scriptures generally. It has published various books of a religious and educational character, including a commentary on the first book of the Adi-Granth. So too the Hindu Sabha, established at Amritsar, aims at social reform and the spread of education: and the Bhiratri Sabha in Dera Ismail Khan is purely secular.
- 5. The Sanatan Dharm Sabha.—The Sanatan Dharm Sabha was founded, as a regular association, in 1889, with the object of preaching the sanatan dharm or ancient faith of the Vedic religion. It sends out preachers, maintains an Anglo-Sanskrit High School and a Sanskrit pathshala, in Lahore, and is collecting a library of Sanskrit works and manuscripts. It adopted the title 'Sanatan Dharm' because it advocates a return to the old faith of Hinduism, but the term is very widely used and was frequently entered as their sect by Hindus of even the lower castes in the Census schedules. How the phrase has become so wide-spread I cannot explain.
- 6. The Arya Samaj.—This quasi-religious organization continues its propaganda which is very far indeed from being confined to a sectarian dogma. Thus Pandit Hari Kishen Kaul, Settlement Collector of Muzaflargarh writes:—
- "It may be noted that the number of Arya Samajists is gradually increasing. Their packets come and give lectures every now and then in towns and villages. The chief features of this school which attract Hindus, and particularly young men "are freedom from restriction, simplicity and economy."

Diwan Narendra Nath, Deputy Commissioner of Gujranwala, gives the following account of the present phase of the movement:—

- "The Arya Samaj movement is not a new one, but there has been considerable progress made within the last ten years. A number of schools have been opened in this District under its auspices. Indeed, where a local body does not see its way to raising the status of a school, or to the introduction of English in the curriculum of studies, the leaders of the Arya Samaj come to the help of the people. Religious instruction is also given in these schools. The Arya Samaj is a reformed Hindu faith, but so annious are the leaders of this movement to keep the reformed within the pale of Hinduism, and in touch with the masses of the Hindu population, that a very small number fully act up to the reforms which they desire to carry out. The Arya-Samajic faith seems to be working its way like the religion of Nanak. The resembling features are:—
 - (1) A purely theistic teaching in place of the polytheism of the Puranas;
 - (2) Observance of caste rules with non-Hindus;
 - (3) Proselytism to a modified extent;
 - (4) Professed abolition of caste rules both with regard to inter-marriage and interdining with the Hindus;
 - (5) The suitability of the two faiths to the lower classes of Hindus, and the apparently little effect which either of them has produced on the Brahmins.

The faith preached by Nanak spread amongst the masses of the Hindu population. The Arya-Samajic faith is confined only to the urban population up to the present, and is not likely to replace the religion of either Bawa Nanak or of Guru Gouind Singh. It is a movement for a general religious reform amongst the Hindus. This reform is capable of further developments, and of assuming phases more advanced."

The following notes also show how inadequately the Arya Samaj is described as a sect. Only one of them lays stress on its religious tenets:—

"The Arya Samaj of the Jullundur District has split up into two or three sections, each differing from the other on minor religious points and there is at present but little barmony among them."

Sanat Kumara, Sanada, Sanaka and Sanatana were the four mind-born sons of Brahma, who declined to
create progeny. Rupa and Sanatan were also two of the six Gozains of Chaitanya the great Vaishnava reformer.

And again :-

"In the town of Ambala the only religious sect of any importance among the Hindus is the Arya Samaj here. The majority of its members are men who have received an English education.

The Deputy Commissioner of Gurgaon also writes :-

"There are no religious societies established here except the Arya Samaj which is established in several places. This is the only religious movement which has spread during the last ten years. The numbers are increasing gradually. Many Ahirs have commenced following the principles of the Samaj. One great result of its spread has been the dimination in expenditure on marriages and other occasions which is a move in the right direction.

The main 'religious' question on which the Samaj is at present divided is, apparently, the lawfulness or otherwise of animal food. There are at present two parties, one the vegetarian or Mahatma, the other the flesh-eating or 'cultured' party, and each publishes its own newspapers. The former, however, is by no means narrow in its views, for it favours female education. The Mahatmas are desirous of founding a College at Kangri near Hardwar but are not agreed as to the curriculum, one section being anxious to prepare the pupils for Government examinations, the other to impart only instruction in the vedas. The cultured party holds possession of the Dayanand Anglo-Vedic College at Lahore, and is thus also called the Anarkalli or College party, as opposed to the vegetarian or City party.

7. The Castes of the Arya Samaj .- The Arya Samaj has returned 9,105 male members, of 15 years of age or over,

in the two Provinces, only 496 being returned in the North-West Frontier Province and 232 in the Native States. The principal castes enrolled in the Samai are given in the margin. The movement is thus practically confined to the educated castes, a few of the artisan and menial classes being also attached to it. It may, however, be doubted whether the 24 Chamars who profess to belong to the sect are really members of it.

8. Distribution by Districts .- The members of the association are most numerous in the Districts noted in the mar-935 649 622

gin. In the Districts of the South-East Punjab the movement is not so active. Ambala only returning 313 members, Karnal 263 and Delhi 129. Generally speaking the association has most members in the Districts where the chief castes noted in the preceding paragraph are numer-

q. Comparison with the figures of 18q1.—Exact comparison with the return of 1891 is not possible, because in Paragraph 118 of Punjab Census Report, 1892. that year the Aryas of both sexes and all ages were tabulated. The numbers then were 16,275, of whom 9,510 were males, as against the present figures of 9,105 males over 15. The movement then is, numerically, making very slow progress.

10. The Dev Dharm .- This organisation continues its activity. It claims to be absolutely non-sectarian and advocates Vide para. 120 of the Punjab Census Report, 1892. tolerance of all beliefs, having no dogmas of its own. Based on certain rules of practical morality and conduct, it has regular orders such as Brahmacharya and Upecharya into which its adherents are initiated. It, in 1900, founded four new schools, one girls' school, and a night school for adults. It has succeeded in obtaining lawyers to defend innocent

These are Hindus only, and the Sikhs (78 males and 39 females) returned as Aryas have to be added to the above figures, vide Sub-Table V.

persons accused in the criminal courts, who could not pay counsel, without charge: in closing liquor shops: and in inducing people to abstain from the use of strong drink and meat.

- It has no longer, I am now desired to say, any hostility towards the Arya Samaj.
- 11. The Chet-Ramis.—The following account, taken from the District Census report of the Lahore District, of the Chet Ramis, who appear to be mentioned in paragraph 113 of the Punjab Census Report of 1892 as denying the existence of God, is of some interest. It will be seen that the sect professes a worship of Christ.
 - "The sect was founded by one Chet Ram some 35 years ago.
- His life.—Chet Ram was born in or about the year 1835 at Sharakpur in the Lahore District. His father was a shopkeeper and maney-lender of the Arora caste. Chet Ram was a man of little education and could read the landar character only. When 25 years of age he began his present misson and very soon gathered round him a number of disciples. He died about 1895 and after his demise his daughter was installed on his gadi. He was burnt near the village of Bhuchoke, where three fairs are held annually to commemorate his memory.
- His Teachings.—Implicit confidence in Christ as the only God was the chief basis of his teaching. A copy of the Bible was to be worn by each of his disciples round his neck. His disciples were also to carry a long rod with a cross at its head. The front portion of the horizontal part of the rod bears the following inscription:—
 - 'Help, O Jesus Christ, Holy Ghost, God! Read the Bible and the Gospels for salvation.—(CHET RAMAIN).
- His followers.—The followers of Chet Ram belong mainly to the poorer classes. They are to be met with chiefly in the Ferozepur, Lahore, Amritsar, Gurdaspur and Montgomery Districts. Forty persons are always to subsist upon alms and preach the teaching of Chet Ram. These are to remain celibate all their lives. The number of his followers is increasing day by day, but Hindu converts do not mix with Mohammadan converts and caste prejudices remain untouched."
- 12. The older forms of Hinduism.—In marked contrast to the reforming movements which thrive in the towns among the educated classes are the beliefs which still hold their ground in the South-West and in the Himalayan Area. The centre of Hindu religious activity in the former area is at Uch Sharif, which is also the great stronghold of the Mohammadan Sayads. Uch still contains the Hindu temples of Gopi Nath, Narsinghij and Khetr Pal, side by side with the shrines of the great pioneers of Islam, but the two creeds as there taught are entirely distinct, and though Mohammadans and Hindus worship in unison at various other shrines in this part of the Province their usages and beliefs have, as a rule, nothing in common. On the other hand it is easy to trace many parallels between the Hinduism of the Himalayas and Mohammadan beliefs in the South-West.
- 13. Hinduism in the South-West Punjab.—The Hindus of the southwest of the Punjab appear to have preserved or developed a form of Hinduism which is in some respects different from the forms found elsewhere. In the first place each caste has its characteristic worship. Thus the Pushkarna Brahmans are especially the followers of the Gokalia Gosains, whose leaders are called Nai Lingi, though other castes, such as Brahmans and Aroras, also worship Gokal. The Muchan, a branch of the Pushkarnas have their own temples, for some four centuries ago they were ordered by their deities—Matrani, Alwadrani, Gungi-rani and Khetr-pal—to quit Bikaner, and promised guidance from light and the ringing of bells. When these signs ceased at Kahror they halted and founded eight asthans or temples, but eventually quarrelled and dispersed. Two of these eight temples were re-founded at Harian near Adamwan some 200 years ago. Each consists of three bricks only, two being placed upright and the third across them. A stone brought from Marwar forms a third wall to this 'temple', and in it a lamp is placed on the 14th of each lunar month. People from the north-east visit the eastern temple, and others the western, the temples standing about a yard apart. At these temples Hindus perform the chola or ceremony at

which children are dressed for the first time. The Alwadrani's temple at Derawar in Bahawalpur is especially frequented by Aroras for this rite on the 14th of every lunar month. A goat is then sacrificed, but it must first shake its head in token that the sacrifice is accepted.

Gopi Nath .- The cult of Gopi Nath still flourishes at Uch Sharif, in Bahawalpur, where it has an ancient temple. Gopi Nath was the son of Vashu Deo, a Kshattriya, and of Deokiji the daughter of Ugarsen, the ruler of Mathra, and was believed to be an incarnation of Krishna. His image is of a dark colour, like his complexion, and is kept adorned with ornaments and clothed. His other names are Vas-deo, Madu Sudan, Rishi Kesh, Bindraban Bihari, etc., and he is worshipped both by men and women before sunrise and after sunset. His Brahman pujaris must place food before him twice a day or else the god goes to the bazar in the guise of a child and pawns the temple treasures. This was the cult which Lalji revived in the sixteenth Puniab Census Report, 1802, 6 66.

century in the South-West Punjab.

Idols.—Images of Krishna, of Girdhari Lalji (in Lalji's temples), of Brij Mohanji (in Kala Dhari's temples), and of Gondahji, are all of metal, while that of Ganja Mali is of bronze. Stone images are made of Sanwal Shah and of Mangal Das. The idol of Khetr-pal in his temple at Uch Sharif is of granite-a cubit in height.

River-worship.—At Khanpur, in Bahawalpur, the Aroras and Bhatias marry Bhang-ki-matti, (lit: a pot of bhang), to Darya Sahib, the river Indus, in Sawan, Brang-Re-made, fit: a pot of orangl, to Darya Sanho, the river indus, in Sawan, with great pomp. This pot is kept in the house of a Bhatia and is always replenished so that the quantity in it may not vary. At Bahawalpur itself an image of Darya Sahib is made of reeds and in this is placed a large lamp. The image is then garlanded with flowers, worshipped and thrown into the river. This too occurs in Sawan. We shall find a ceremony very like this repeated in the worship of Devi, while Darya Sahib re-appears in the following account of the interesting shrine of Zinda-Kaliana in Ihang.

Zinda-Kaliana .- Mr. Maclagan's account of Zinda-Kaliana points out that Kaliana was a Vaishnava and apparently Funjab Census Report, 1892, § 68. the cult should be regarded as an offshoot of the worship of Vishnu. It has some curious features. Jinda or Zinda, 'the living one,' was a Bunjahi Brahman of the Genhdar' got, while Kaliana was also a Bunjahi of the Sahr got. Kaliana's descendants are, Gosains: Zinda was celibate and his spiritual descendants are Fagirs of Zinda-Kaliana.

The Mahant or Guru appears to be one of the fagirs. Now the fagirs wear a cap of silk (daryai, or gulbadan), round which they bind a black strip of woollen cap of silk (daryat, or gulbadan), round which they pind a piack strip or women cloth (seti), shaving the head, but keeping the chots to tut of hair, like Hindus, and the beard and mustaches. They also wear shoes, a majhla, or waist-cloth a lingoti, a kurta or shirt and a chadar or shawl. They also carry a mala or rosary and a necklace of tulsi beads. The Mahant, however, may not wear a shirt or shoes, though when walking he is allowed sandals. He must always sleep on the ground, or on a manuha, a square bed of grass made on the earth between four posts. The chelos or disciples may sleep on beds. Further, the Mahant must eat on a separate asan, or mat, though the fagirs may eat on the same asan and in the same chauka with one another or with Brahmans: they may also eat in the same chauka, but on separate asans, with Khatris and Aroras. The Mahant may also take food from Brahmans, Khatris or Aroras, but he can only drink water drawn with a dur, or rope, in a lota, but his chelas may use water drawn in earthenware. He also has a separate, huqqa, but the fagirs may smoke with Brahmans, provided the latter are willing to allow them

The fagirs employ Brahmans for religious and ceremonial purposes, but not so the Gosains, who, like other Hindu castes, call upon the daughter's son,

[•] The Genhaar are the Brahmans of the Mohammadan Sials of the Jhang Bar-

the son-in-law, the sister's son and husband to take the place of the Brahman, who is only employed when no such relative is available. The faqirs receive the bhent or offerings made to the samadhs: the Gosains receive ardas (alms) or dan. The former however now visit their followers to collect offerings. the takia, or residence of the Mahant, stand the samadhs or tombs of Zinda, Kaliana, Amadiali, and Darya Sahib, a chela of Zinda, while close by is a house in which a sacred fire (dhuan *) has been kept burning for four centuries. This in which a sacred hre (dhuan *) has been kept burning for four centuries. This house also contains a long red flag, which is worshipped, and conch shells and bells which are used when the dhup grass is reverenced. Bhang is offered daily and is also taken regularly by the Mahant. The fagirs, after preparing their own food, offer bhog (or sacramental food) to the samadhs. The fagirs and the public worship the samadhs, the dhuan or sacred fire, and a tulsi plant growing near by. The Gosains or secular priests intermarry with all the Bunjahi Brahmans: and avoid of course widow re-marriage.

The rule that priests should sleep on the ground is ancient and widely Journal Anthropological Institute, Volume XXX, 1900, quoting Spread. The Selloi, priests of the Polaccian Zone had to sleep on the ground, 'with unwashed feet.' Ghosts cannot touch the ground, and just before and after marriage a bride and bridegroom must sleep on the ground. After a death in the house no one sleeps on a bed for several days. At Khangah Dogran and Sakhi Sarwar no resident or pilgrim may use a bed, out of respect to the saints there worshipped, and similarly at Sankhatra the Deo Jats are so holy that no Jat, even if he be a Deo, but of another place, may sit anywhere but on the ground.

These ideas are in curious, and, as far as I am aware, unexplained contrast to the rules which forbid divine personages, like the Mikado, to touch the ground. If the Mahant of Zinda-Kaliana is a worshipper, and in some sense an incarnation of Vishnu, (he must eat bhang in that capacity), that rule should

apply, just as Krishna is worshipped by swinging Frazer: Golden Bough, Volume I, page 146,

his images, and as his representatives in Bombay and Central India are swung in pendulous seats. Possibly Zinda-Kaliana represent Vishnu and Siva, the rites of the two cults having become fused together in the course of time. But that the basis of the cult is Vaishnava appears to be clear from the fact that its fair is held on the last day of Chet and the 1st of Baisakh, days not sacred to Shiva.

14. The religion of the Gaddis.—The religion of the Gaddis presents some interesting features and a brief description of it may be useful. As we have seen the Gaddis are by preference Shaivas, but their worship is catholic to a degree. Thus on Sundays and Thursdays Nags and Sidhs are worshipped, on Sundays alone Kailung, on Thursdays 'Birs,' and on Tuesdays Devis.

To the Nags, ahri, or beestings, male kids or lambs, and ora, the first-fruits of all crops, incense and small cakes are offered: and to the Sidhs a sack, a stick of rosewood, a crutch, sandals and rot or thick bread. The latter gifts clearly denote the character of the Sidhs, being things which are bestowed as alms on wandering devotees.

To the Birs a he-goat, a chola or thick woollen coat, a waist-band, a white four-cornered conical cap (chukanni topi) and fine bread. It seems equally clear that the Birs are heros, and as such receive offerings emblematic of their character in this life.

To the Devis are offered vermilion, bindle,1 salu,3 dore3 (the finery beloved of the sex), with sur4 (a coarse spirit), and a goat.

Kailu Bir, the numen of abortion, is only worshipped by women. Kailung is a Nag. He is worshiped, as is Shiva, under the form of the drat or sickle,

There is a section of the Bunjahi Sunars called Dhuan, because it keeps up a perpetual fire.
 A glass ornament stuck on to the forehead.
 Salus, a mail sheet worn over the head.
 Dora, a girdle of woollen rope.
 Rice-berr.
 Rice-berr.

which is always carried by a Gaddi when shepherding his flocks. Then there is the worship of autars. An autar is the spirit of a person who has died childless, and who, therefore, causes sickness. To propitiate this spirit the sick person puts on clothes, which are specially made for him, with a silver image of the deceased, which is worn round the neck and he then worships the autar, or idol (which is always kept near a stream). The clothes and image are worn "in token of the deceased." Autars are propitiated also on the Amawas and Puranmashi days.

The seasons for worship are: - Chet, when pilgrimages are made to Bhaun and Jawalaji in Kangra. Chet is the sacred month of orthodox Hinduism. Bhadon and Asauj are the months for pilgrimages to the shrines of Narsingh, Hari-har, Lakshmi Devi, Ganesh, and Kailung in Barmaur, visits being made in Bhadon only, as a rule, to Mani Mahesha. Shiva is not worshipped at any particular season.

The chief fairs are seven in number, vis., the Basawan or 1st Baisakh, the Patroru or 1st Bhadon, the Sair or 1st Asauj, the Lahori (or Lohri) or 1st Magh ration of 1st bhadon, the Sair of 1st Asaul, the Lahori (or Lonn) of 1st Magn and the Dholru or 1st Chet. The dates of the Shibrat (in Phagan or some other date), and of the Holi (in Phagan or Chet) vary. The first four festivals are celebrated by games and dances, but there are differences in the rites observed. At the Basawan pindiris or flour cakes are eaten with ghi and honey. At the Patroru a cake of siul is eaten: only young girls dance. At the Sair babrus are cooked; and at the Lohri khichri, or rice. At the Holi khadda, or maize flour, is eaten, the fire is worshipped at night and a performance called barn held, songs being also sung. At the Dholru again pindiris are eaten, but amusements are rarely allowed. There seems to be no annual feast of the dead. Shiva and the Devis are sacrificed too on a Shibratri.

But these do not exhaust the list of beliefs. Batals are the sprites of springs, rivers and wells, and khichri, sodden Indian corn, 3 balls of subal, 4 3 of ashes, 3 measures of water, a pumpkin or a flour-sheep are offered to them. To Jognis or rock sprits, 3 coloured grains of rice, 5 sweet cakes, a loaf, a flour lamp with a red wick, 3 kinds of flowers, 3 pieces of dhup 5, and a she-goat of flour are offered with prayers. Rakhshanis and Banasats would seem to be the same as Joginis. Chungu is the demon which sucks the milk of and is found on walnut and mulberry trees and under the kargun shrub. He is worshipped with a cocoa-nut, a chuhora,6 almonds, grapes, milk and a loaf of 5 paos weight with his effigy in flour, a basket on his back and a four-cornered lamp of flour on the bread, and a piece of dhup.

Gunga, the disease spirit of cows, is propitiated by setting aside a tawa of bread in his name until the final offerings can be made. Then a piece of iron, something like a hockey-stick, is made and the deity taken into the cattle-shed, where he is worshipped by the sacred fire on a Thursday. A he goat is killed and a few drops of the blood sprinkled on the iron. At the same time cakes are offered and some eaten by one member of the household, but not by more than one, or the scourge will not abate, and the rest are buried in the earth. Every fourth year this deity is worshipped after the same fashion.

Kailu is, I believe, peculiar to the Gaddis, or at least to Chamba. Early in pregnancy the woman puts aside 4 chaukelis, the copper coin of Chamba with her necklace in the name of Kailu. Two or three months after delivery the parchit, with the woman, worships the demon by putting up a large stone under a walnut or kainth? tree, which is sanctified by reciting certain mantras and then worshipped. A white goat (which may have a black head) is then offered up to the demon, by ymaking an incision in its right ear and sprinkling the blood over a long cloth, 21 ards wide and 9 or 12. yards long, and the chaukelis and some bread are also

[|] Siul-parched gram.
| B.bs = leavened breed fried in oil.
| B.bs = leavened breed fried in oil.
| Pindiris are made of kodra flour and milk or butter-milk.
| Subul-moss. |
| Dhup = incense. |
| Guukora = handle of a plough.

[•] Chuhora = handle of a p • Kainth = wild pear tree

offered to the demon. Finally the woman tastes a piece of gur, and places it on the cloth, which she then wears until it is worn out, when a new one is made and purified in the same way before being worn. The ceremony may be performed at the woman's house, in which case the cloth alone is used as a symbol of the deity. The goat is returned to its owner with the four coins. No other woman may use this sheet, which would cause her diverse bodily ills.

There is a curious mixture of magic and religion in the Gaddis' beliefs. The image of the autar or jealous dead has its exact counterpart in the saukan mora or, 'crown of the rival wife,' the silver plate, worn by a second wife when the first one has died, which represents the latter and is propitiated to avert her hostility—the sawatia dah or 'co-wife's envy.'

Shiva, it is interesting to find, is as always worshipped under the form of an instrument, never being represented by an image, and consistently with this his fettivals are not held on fixed dates.

The festivals are peculiar and their meanings cannot be explained. The Basawan appears to be the festival of the dwelling-place, (c.f. bas, hamlet,) being possibly derived from basna to dwell.* It is the festival of the new year. The Patroru is perhaps sacred to the manes of ancestors; and the Dholaru is the day on which drums are beaten, Chet being the last month of the year.

15. Dewat Siddh.—The Siddhs of the Himalayas do not appear to be connected with the Jogis, though they may be spiritual relations of Gorakhnath, as the following account of Dewat. Siddh shows:—

Bawa Bolak Nath was born in the house of a Gaur Brahman at Girnar Parbat, a famous place of pilgrimage for a sect of faqirst in Kathiawar. He was the disciple of Ridgir Saniasi, and wandered to Changar Talai in Bilaspur where he became the cow-herd of a woman of the Lohar caste. Some Jogis attempted to convert him and pierce his ears by force, but he refused to abandon his faith and called aloud, whereupon a rock close by split open and he disappeared into the cleft, in which he is supposed to be still alive, though he was born 500 years ago. A sacred firet is kept burning in the cave, which was made by enlarging the cleft and reached by a ladder placed against the clift. The priests are Gosains who are celibate, and Brahmans, who receive 9 as. 6 ps. of the income while the rest goes to the Gosain chief-priest. The titnerant chelas collect offerings in kind, such as flour, out of which rot or large loaves are made for the other Siddhs. The followers of Dewat Siddh carry a small wallet (jholi) and a Jogi's crutch phaori.)

Hindus, Mohammadans and low-caste people alike offer sacrifice: for example Bangali snake-charmers offer cocks, and Hindus a goat which must shake itself to show that the sacrifice is accepted. Adherents of the sect (for such they may be called) should visit it every third year, and Sundays, especially the first in the month, are the best days for worship. Women cannots enter the cave, but they may make offerings to the lesser images of the Siddh at the foot of the ladder. In the cave itself are three images of the Siddh, one of stone, said to be the oldest, and about a foot high, one of white marble, and a very small one of gold. The cliff is covered with carvings of Hindu gods, etc. Connected with this shrine are those of the brothers of Dewat, Balak Rupi near Sujanpur and Baroh Mahadeo near Jawala Mukhi, in Kangra; and other Siddh shrines have been founded at Banga, in Jullundur, and in Mandi, as the cult is spreading and its popularity increasing.

The legend points to some old dissension between the Jogi worshippers of Shiva and those of Bhairava, the earth god, and the fact that a cave is used as the temple also points to earth-worship.

I do not know if visakh, a court-yard, is connected with Baisakh.

[†] They are 'akin to the Jogis,' (Punjab Census Report, 1892, § 46, page 107).

² On this the bhog or food of the Siddh is cooked.

^{\$} Another account says they can. Probably they cannot enter if ceremonially impure.

16. The Sikhs .- The number of Sikhs in these Provinces, according to the present returns, is 2,130,987 as against 1,870,481 in 1891, an increase of 260,506, or 13'9 per cent. If these figures are at all accurate, Sikhism has made a marked advance since 1891, possibly at the expense of Hinduism, for the Hindus only show an increase of 24 per cent.

It will, however, be clear from a perusal of Mr. Maclagan's chapter on Punjab Census Report, 1892, Chapter III, §§ religions that nothing but an exhaustive tabulation of the sects of all religions can

give us any idea of the value of the returns. Unfortunately all the Hindu sects were not tabulated on this occasion, and we are in consequence quite unable to say how many Guru Govind Singhis or Akalis have been returned as Hindus. To obtain some idea of the meaning of the Sikh figures I had the Sikh sects tabulated in British Territory and an an-

Subsidiary Table V.

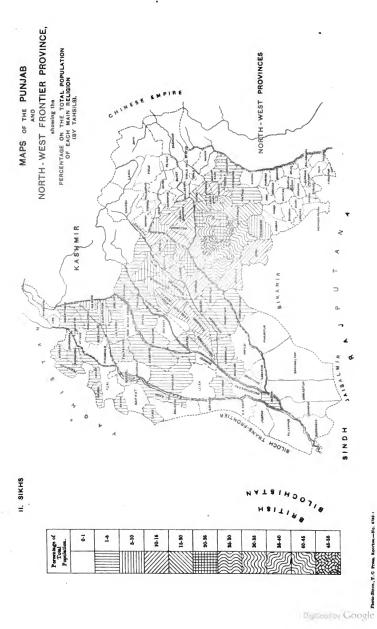

alysis of the results is given at the end of this chapter. To each entry I have prefixed the number of the paragraph of Mr. Maclagan's report of 1892 in which a description of the sect will be found. In discussing the figures of the present Census I shall add such scraps of information regarding each sect as I have been able to obtain.

17. Variations in Districts and States .- In the first place, however, attention may be called to the figures show-Subsidiary Table 1. B. ing the percentage of variation in different

Districts and States. In Ambala the Sikhs have decreased from 87,650 in 1891, (excluding Thanesar Tahsil) to 58,073 or nearly 34 per cent. The decrease in this District appears to be due to an exodus of pattidari families who, finding it impossible to live on their minutely subdivided allowances, have returned to their original homes in the Manjha. The increase in the Phulkian States, which amounts to a fourth in Patiala and Nabha, and to 100 per cent. in Jind, is, I am told, due to the revival of Sikhism which ensued on the organisation of the Imperial Service Troops, recruits being induced to take the pahul on enlistment. Possibly this has also influenced the Hissar figures. Colonisation explains the increased numbers in Jhang, Montgomery and Gujranwala, the Sikh Jats having been settled extensively on the Chenab. There remains, however, a marked increase in Jullundur, Ludhiana, Faridkot, Gujrat and Rawalpindi which one could not hesitate to attribute to a revival of Sikhism, if Amritsar did not show a higher rate of increase among the Hindus, but in this District Sikh emigration may fully account for the comparatively small rate of increase among the Sikhs. In Ferozepore the rate of increase would have been much larger, but for the fact that in 1891 64,333 Chuhras were returned as Sikhs, as against 5,388 in 1901, in that District.

Speaking generally the increase in the number of Sikhs is confined to the more central tracts of the Punjab for in the south-east, in the Himalayan area and in the extreme south-west the numbers have decreased in a more or less marked degree.

18. Sikhism .- While Hinduism may he described as a social rather than a religious organization, Sikhism, it may be said, is something more than a religious system. The term 'Hindu' does not necessarily imply any particular belief, for, as a Hindu writer has said, Hinduism is merely 'what the Hindus, or the major portion of them, in a Hindu community, do', and no further definition can be attempted. The term Sikh, on the one hand, implies acceptance of the tenets held by the Gurus, and, as in all eastern religions, those tenets are partly religious, and partly connected with social observances. But, as happens in all religions, those tenets are not obeyed with the same exactness by all who profess Sikhism, and so we at once find three degrees, as it were, These are, first, the zealots such as the Akalis, who follow all the ordinances of Guru Govind Singh, secondly, the true Sikhs or Singhs, who observe his main ordinances, such as the prohibitions against the use of tobacco and cutting the hair; and lastly, those Sikhs who retain many, or perhaps most, of the Hindu beliefs and usages, and yet profess a devotion to the tenets of the Gurus.

The true Sikh is 'a follower of the ordinances of Guru Govind Singh'. Now as far as religious doctrines are concerned the Guru did not, in any essentials, depart from the creed of his predecessors. Guru Nanak himself stood quite within the pale of the orthodox Hinduism of his time, though he was a monotheist and endeavoured to continue that movement against the grosser forms of idolatry which had been begun or revived by his forerunners, especially by Kabir. This teaching Guru Govind Singh did not essentially change. He inculcated the belief in the one Supreme Being, though he himself was a worshipper of Durga, and in his Granth the adoration of the minor deities is by no means rejected. The main strength of the Guru's reformation lay in his social ordinances. He endeavoured to cut his followers completely adrift from the social tyranny of Hinduism as well as from the political tyranny of the Mohammadans, and to effect this the more thoroughly he prescribed, as so many religious reformers have done before and since, an uniform and certain ceremonial observances as outward signs of the Sikh creed. Thus to mark their repudiation of Hinduism his followers were to discard the sacred thread (mis-called 'of caste'), the Hindu sacred books and rites at birth, marriage, and death : while to signify their aversion to Islam no Sikh was to wear a cap, or eat meat killed in the Mussulman fashion. To show that they were a people consecrated to the service of God, the Guru caused the Sikhs to adopt the ancient religious rule that those who were under a vow should leave the hair uncut, and he also ordained that tobacco should not be used, reviving a common ceremonial prohibition, the exact significance of which is obscure.

But the reforms of Guru Govind Singh went far deeper than outward signs or ceremonial. He endeavoured to reform the social system of the country from top to bottom, for he preached the absolute equality of all castes, not only in the actual presence of God, an idea which is not confined to Sikhism, but in daily life. In this he was but partially successful, for though Sikhism has done an immense deal to level down the barriers of caste, even the true Sikhs still continue to avoid contact with the unclean castes: further by his insistence on this social doctrine the Guru rendered the failure of the Sikh propaganda amongst the higher classes of Hinduism all but inevitable. Consistently with this crustade against social inequality the Guru also forbade the murder of girl children, and the acceptance of a price for a daughter given in marriage, thus greatly raising the position of women. The results of this teaching are doubtless to be seen in the freedom enjoyed by the women in Sikh families, in their better education, and the kindness with which they are treated. The Kukas, an offshoot of the Govind-Singh sect, continue to condem female infanticide, and are still the object of those slanders which attack every movement in the East for the emancipation of women. Whether Guru Govind Singh was entirely successful in this attempted reform is another question.

Thus the object of Guru Govind Singh was the foundation of a religious commonwealth, and the earlier writers on Sikhism in the last century were perfectly justified in speaking of the Sikh nation,

The Sikh creed.—It is not easy to say what is the distinctive creed of Sikhism. It is nearly always difficult that the Gurus, from first to last, strove, like the modern Hindu reformers, not to break away from the ancient beliefs, but to reconcile them with a purer creed. Unfortunately this resulted, as probably it always must result, in a medley of beliefs, so that within Sikhism we find many religious ideas at variance with its ideal creed. That creed involves belief in one God, condemning the worship of other detites: it prohibits idolatry: pilgrimages to the great shrines of Hinduism: faith in omens, charms or witchcraft: and does not recognize ceremonial impurity at birth or death. As a social system it abolishes caste-distinctions, and, as a necessary consequence, the Brahmanical supremacy and usages, in all ceremonies, at birth, marriage, death, and so on. But this creed is probably accepted and acted up to by a very small number even of those who call themselves frue Sikhs.

19. The definition of 'Sikh.' We retained in the present Census the rule, introduced, in 1891, which defined a (male) Sikh as one who wears the hair long, (kes), and refrains from smoking. To this was further added the instruction to enter the religion of the women as stated.' There was no definition in 1881. to enter the religion of the women as stated. There was no dennition in 1881. In the present Census this rule was, I have little doubt, almost universally ignored, and in 1891 it was not carefully observed, the result being that the Sikh figures for that year exceeded by 30 per cent, according to Mr. Maclagan's estimate, the numbers which should have been returned as those of the true Sikhs.' These results seem the reverse of satisfactory. If a rule is laid down and then only partially followed the returns obtained must be of uncertain value. We cannot say with accuracy that in so many cases the rule was followed and in so many disobeyed. The question then arises whether such a rule can be enforced, as if not it should be amended or revoked. I am inclined to think that at a future Census this attempt at definition should be abandoned. In the first place it is clear that strict observance of the rule would have excluded a certain number of the community from our return of Sikhs. In the next place the rule was objected to in nearly every District in which Sikhs exist in any numbers. and I was frequently asked how the muna Sikh (or those who cut the hair) should be recorded. Obviously it would have been a little difficult to say that they should be recorded as by religion Hindus, seeing that they strenuously deny that they are Hindus, and direct that they should be returned as Sikhs by sect, for that would merely vitiate our sect returns. If we had such entries as 'Hindu (by religion), Sikh (by sect),' we should not be much wiser than before, for in a sense all Sikhs are Hindus and are so called in common parlance. As Mr. Maclagan observes, the line between Sikhs and Hindus is vague in the extreme, and the best course therefore would seem to be to record those who extreme, and the best course Increaser would seem to be to record those who return themselves as Sikhs as such, and trust to the entry of sect, if any, to enable us to classify the followers of Guru Govind apart from those of Bawa Nanak, as has been attempted on this occasion. Unfortunately there is an increasing tendency, already noticed, for sects not to be returned, but possibly this difficulty could be got over by asking that Singh Sabha, Sohdbansi, etc., should be returned as sects, and also directing that, if no other sect entry be made, the term muna be inserted in the case of those who do not observe the distinctive ordinance of Guru Govind Singh.

20. The Sikh Sects,—In the recent Census 731,198 Sikhs, or 40 per centretured no sect. This is far in excess of the numbers shown as returning no sect in 1891, and at first light seems to point to imperfect enumeration. It is, however, to be attributed, I think, to a tendency to abandon the sects and join the religious associations, the Sabhas and so on. The Singh Sabha, the chief Sikh association, has not been returned as a sect. The omission to return any sect is most noticeable in Amritsar itself. Further a good many entries in the column for sect did not relate to sects at all. Such were Ram Granthi (158), Mahrabia, (49), Gyani (17), Pujari, (17), Rababi (3), mostly in Amritsar, and Masand (20), in Ambala, all of which describe offices in Sikh temples.

Sheikh Dhari (Shahpur)		740
Sahib Ram Kaur (Sialkot)	***	136

A good many other entries relate to sects not mentioned in the last Census Report. Some of these I note in the margin, but the number of names not traceable is over 50, and includes such terms as Rahtor (125) in Muzaffargarh and Dera Ghazi Khan, and Kali Shah (86) in Ludhiana. Regarding these sects I have no

information.

They are probably old sects under new names, but instances of individuals starting a revivalist movement are not unusual, as in the following case, described in the Jullundur Report:—

"A fakir named Mathra Das has been preaching among the Hindu Jats during the last 2 or 3 years, and some of the Jats have become Sikhs owing to his teachings."

This mahant appears to have 102 followers in Hoshiarpur, but none are returned in Jullundur. But with these exceptions the present conditions of

Sikhism closely resemble those of Hinduism, for, instead of new sects being founded, the tendency is to organize societies of which the two most prominent are the Singh Sabha and the Sohdi-bans.

21. The Singh Sabha.—The Singh or Sri Guru Singh Sabha is apparently the most active organisation in Sikhism at the present time. The Deputy Commissioner of Amritsar writes:—

"Among the Sikhs, the Singh Sabha seems to stir up people, and its working members are to be seen not only in the city and towns but are found busy in rural areas inculcating principles of the Sikh faith and enjoining the necessity of a separate religious and political existence."

Mr. W. S. Talbot, Settlement Collector, Jhelum, says :-

'The Singh Sabha, I am informed, is increasing in vigour, and is developing into a separate sect (which I personally supposed it to be already)."

The District Census Report of Rawalpindi naively but truly describes the position thus:-

In Sikhism there are three classes :-

- (a) Followers of Sir Khem Singh Bedi, (b) Nirankaris, (c) the Singh Sabha. The two former are declining while the third is spreading. A registered association, the Singh Sabha, founded on original pure Sikhsim was established for the spread of education and the reformation of the Sikhs. As education advances the followers of Sir Khem Singh Bedi and Nirankaris are joining the Singh Sabha."
- 22. The Sohdi-bans.—The Khalsa Sohdi-bans is a new reforming movement among the Sikhs, which has only just been started, and it aims at a return to the pure religion of Guru Nanak. It has already over 2,000 followers, according to the Census returns, scattered over these Provinces, but chiefly found in the north-west, especially in Sialkot, Shahpur and Rawalpindi. The term Sodhibans, or as it is also spelt Sohd-bansi or Sohdi-bans, is however not new, as it has long been used for one belonging to the Sodhi class, for every Sikh when taking the pahul must leave the caste in which he was born and enter that of the Guru Govind Singh, who was a Khatri of the Sodhi section. The word Sodhi itself, however, appears to be derived from sohd a ragni, or musical mode.

This movement appears to be allied to the reforming sect, a description of which follows.

23. Bhagat-panthis.—This sect of the Nanak-panthis appears to be quited distinct from the Bhagtis or followers of Baba Suraj of Chaha Bhagtai in the Kahuta Tahsil of Rawalpindi. It is found in the Bannu District, in Paharpur, and in Tahsil Dera Ismail Khan.

While reverencing the Granth the Nanak-panthis observe the usual Hindu ceremonies at marriage or death, but the Bhagat-panthis do not. They take the Granth to their houses, and read certain portions of it at marriages. Marriage and betrothal ceremonies may be performed at a dharmsala, or the marriage may be celebrated by taking the Granth to the house and there reciting portions of it. No funeral rites are performed and the dead are buried, not burnt. Passages from the Granth are read for a few days after the death. And on occasions of marriage or death karah parshad is distributed. There is no rule of chhut or 'touch,' forbidding contact with other castes. The sect makes no pilgrimages, avoids idolatry, and performs no shradh for the dead. Daily worship is an essential duty and consists in recitations of the Granth at six stated hours of the day, vix, before sunrise, before noon, after noon, before sunset, in the evening and at night. At worship they sit down eight times, rising eight times and making eight prostrations.

This sect then strives after pure Sikhism and freedom from Brahminipular and the movement in Gujrat described below:—

"The Bhatias, Aroras, and many Khatris of Phalia profess the Sikh religion. Sikhs of advanced ideas wish to follow the tenets of Sikhism on the occasion of marriage so as to

exclude Brahmans from the ceremonies. One or two such marriages have taken place at Wasu in Phalia, but the majority of the Sikhs are opposed to it as a useless innovation. The leader of the new school is said to be a resident of Jalalpur Kikuan in Jhelum. His name is said to be Utar Singh."

24. The elements of Sikhism .- The sects returned by Sikhs have been classified according to the order in which Subsidiary Table V. sects were discussed and described in the

Census Report of 1802. It will be seen that a number of sects, usually regarded as Hindu, have been returned, sometimes in not inconsiderable numbers, by the as Hindu, have been returned, sometimes in not inconsistence in the state of the religious books of the Sikhs, is full of extracts from the writings of Kabir and the other Bhagats. Guru Nanak himself stood within the pale of

Hinduism and it is consistent with his tenets that the followers of many Hindu sects should call themselves Sikhs.

25. Khetr-pal.—The few worshippers of Bhairon, or Bhairava, the earthgod under the form of Khetr-pal in Feroze-Punjab Census Report, 1892, § 44.

god under the form of Metr-pail in reforepur are new returned as Sikhs, and not,
as in 1891, as Hindus. But amongst both Sikhs and Hindus Khetr-pal's cult
is probably more widely spread than these figures indicate, for in Gurdaspur
the Hindu Katil Rajputs are said to consult Brahmans as to the auspicious
time for reaping, and before the work is begun 5 or 7 loaves of bread, a pitcher
of water, and a small quantity of the crop are set aside in his name. Punjab Census Report, 1892, § 44.

26. The worship of Devi -7.493 Sikhs are returned as of the Durga Opasak or Devi Dharm sect, exclusive of 482 who are returned as of the Shakat persuasion, and one individual who admits his adherence to the Kola-panth. This latter I assume to be the sect of Kola-chari, who are worshippers of Sakti Punjab Notes and Queries, 1885, \$5 648 - according to the left-hand ritual. believe that Devi or Sakti has ten forms. and every Kolachari is a follower of one of these forms, whose names are thus given:—Matangi, Bhuvanesvari, Baglamukhi, Lalta-Dhumavati, Bhairavi, Tara, Kali, Kamala, and Vidiya. The book of the sect is called Kolanava, and their creed claims to be founded on the Sivatantra.

The worship of young girls as devis crops up again, as the following note from Jullundur shows :-

"Some 2 years ago some enterprising people of the Kapurthala State got two or three young unmarried girls and gave out that they had the power of 'Devis.' The ignorant accepted this belief and worshipped them as goddesses. They visited various parts of the District and were looked up to with great reverence everywhere, but as good results did not follow, the worship died out,"

Devi is personified in a girl under ten years of age twice a year and offerings are made to her as if to the goddess on these occasions. The periods sacred to Devi are the nauratras (or first nine days of the waxing moon) in Chet and Asauj. On the 3rd of Chet Sudi, there is, in Hissar, a special rite, unmarried girls making an image of Gangor of clay or gobar, which is loaded with ornaments and then, after its marriage ceremony has been performed, cast into a well. It is characteristic of the close connection between the peoples of the eastern hills and Rajputana that this rite should be found in Kangra, under the name of Rali worship. Images of Siva and Parbati are made by girls who perform their marriage and then throw them into a pool or river. The ceremonies commence in Chet and end in the sank-ant of Baisakh and are traditionally supposed to commemorate the suicide of a woman married to a boy much Kangra Gazetteer, 1902. younger than herself, but a different

Kangra Gazetteer, 1902. Golden Bough, Il, page 109. explanation has been suggested. The deities Siva and Parbati are conceived as spirits of vegetation, because their images are placed in tranches over a heap of flowers and grass, but this theory leaves many points unexplained, and until we have full details of the rites observed at all the festivals of Devi we cannot attempt to discover the ideas underlying these local rites.

126

27. Devi as the small-pox goddess.—Devi is in Hissar essentially the small-pox goddess, and the rites to cure the diseases are all based on this belief. If a child be suffering from a mild attack, the disease is called Shukar(Venus), and gur is placed under a gharwanji, or stand on which pitchers are kept, and songs are sung. This is termed nam-rakha, or 'naming' the disease. In the case of a severe attack it is termed dusri Shukar, and on a Sunday a Brahman woman makes the child wear a rakhh, or amulet with a gold bead, kapur (mercury), and marjan (a precious stone), fastened with red thread. Bhat or coarse wheat-flour is given in alms in the afternoon, and that night the mother and child sleep on the ground. The former keeps the Monday as a fast and bhat and rice are cooked in the evening. On the Tuesday the child's forehead is marked with cow's urine and young girls are fed with the bhat, with rice and milk, and pice or kaurrs given them. On the Sunday and following days the mother pours lassi or milk mixed with water, on a jand tree, sprinkling some also on the ground on her way to and from the tree. Girls are again fed on the Wednesday and on Thursday morning, and the mother again pours lassi on this day on every tree on her road, and round a kiln as well. On the Monday night following bhat is given in alms and finally women go in procession to Devi's temple, carrying an umbrella of paper, and accompanied by musicians. Chhand, or hymns are sung daidewa. One of the lines sung is:—

'O Devi, thou ridest a tiger under the shade of an umbrella, and a snake is thy whip.'

As long as the disease lasts dhup grass and the dung of an elephant or sheep is burnt, and the child should wear a piece of tiger's flesh tied in a rag round its neck. Ghi may not be eaten in the house after the last visit to the fand tree, and the mother must avoid ghi for forty days, and fast every Monday, Visits of condolence, or receiving bhaji or food distributed at marriages are forbidden, and if any one comes to enquire as to the child's welfare he asks 'maha mai khush hai' 's the goddess pleased' and the reply is 'maha mai mihr hai,' 'she is kind.' The child is called 'maha mai ka gola' or slave of the goddess

Here again we find girls feasted as incarnations of the goddess, and the, attempt to transfer the disease to the jand tree, with due apology, is an orthodox treatment in cases of sickness. The other rites are less easily explained. Clearly there is some connection between the tiger's flesh worn as a charm and the conception of Devi as riding a tiger, but the exact train of ideas is obscure.

28. Shaivism.—The number of Sikhs now returned as worshippers of Shiv, or 'Bawa' Mahesh, whom I take to be Shiv, is considerable, being over 1,800 in Hoshiarpur, Ambala and Jullundur. As we find Sewak Shiv among the Sikhs we might expect to find Saniasis amongst them too, but only 8, mostly in Shahpur, are so returned.

In the Himalayas Siva is worshipped extensively, especially by all the lower castes. The home of Siva is believed to be the peak of Khaskar in pargana Takpa of Bashahr, and music is at times heard on its summit. Old men say that on the smallest of its peaks visible from Chini, is a pool surrounded by mountains amongst which lie Shiva's temple and the homes of the other deotas. Many years ago a holy faqir came to this mountain to worship Shiva and accomplished his pilgrimage, but by returning to ask some favour of the god, incurred his displeasure and was turned into a rock which can be seen from Kailas north of Chini. This rock has a white tint at sunrise, a red at midday, and a green at sunset. Kailas itself is the abode of the dead.

On Sri Khand, a peak 18, 626 feet above sea-level, is a stone image of Siva, called Sri Khand Mahadeva, which is worshipped by placing a cup of charas in front of it and burning the drug to ashes. Everything offered to the god is placed under a stone. Six miles further on, in Kulu, is Nil Kanth Mahadeva, a peak visited by Sadhus only on account of its inaccessibility. It has a spring of red

water. Barmaur again is a Shiva-bhumi or territory of Shiva, and hence, it is said, the Gaddis of Chamba are Shaivas.

The prevalence of Shaivism in the Himalayas may be gauged by the following note by Dr. Vogel:-

"There are no less than 49 places of worship, (44 being temples proper), in Mandi and of these 24 are Çivalayas, 8 Devi temples and 2 are dedicated to Çivaistic deities. This shows the preponderance of Çivaism in Mandi. The number of Thakurdwaras (Vishuu shrines) is seven only. Among the Çivalayas most are Linga-temples but the oldest are dedicated to Çiva Panca-vaktva (i. e. the five-faced) whose curious images are remarkably numerous in Mandi".

Writing of Kangra Dr. Vogel says:-

"Though Givaism no doubt prevails everywhere and all the principal temples and tirthas are dedicated to Mahadeo or Devi under various names, there seems to have been a great deal of Vishnu (or Krishna) worship among the Rajas. At least 1 found this with regard to those of Kangra and Nurpur, who may be considered to have been the more important ones. It seems that while the popular religion was the grosser Sivaism the Rajas took to the higher form of Vishnuism. This seems to be the most obvious explanation though it is guite possible that there were other causes and the Rajas perhaps introduced Vishnuism from the plains. It is curious that a Krishna image in the Fort at Nurpur is said to have been brought from Udaipur in Rajputana."

Similarly in Kulu Thakur Gopal, the cow-herd (Krishna), is worshipped by the former Gurus of the Rajas, though Sivaism is prevalent in the Kulu Valley, and in the Simla Hills the cult of Vishnu is said to be entirely confined to immigrants from the plains, the indigenous population being wholely Shaivas or Shaktaks.

'All castes,' writes Mr. Maclagan, 'are worshippers of Shiv; but he is not a popular favourite in the same way as Vishnu or Krishna. It has been before pointed out that the worship of Shiv is mainly a Brahman worship, and it is undertained to the same way as Vishnu or Krishna. It has been before pointed out that the worship of Shiv is mainly a Brahman worship, and it is undertained to the same worship.

Punjab Census Report, 1892, § 48.

doubtedly most prevalent where the Brahmans have

most power—a fact which conflicts somewhat with the theory sometimes put forward that Shaivism is a remnant of the aboriginal religions of the country.'

It is, in this connection, curious to note that Mr. Ibbetson says :- 'Shivalas

Karnal Settlement Report, 1883, § 364.

are not at all uncommon in the villages, built al-

most without exception by Banyas. The priests are gosains or jegis, generally of the kanphate or ear-pierced clan, and they take the offerings. No Brahmans can partake of the offerings to Shiv, or be priests in his temple, though they will worship him and sometimes assist in the ceremonies, thus deviating from the strict rule of the original cult. On the Sheoratris, on the 13th of Sawan and Phagan, such people as have fasted will go to the Shivala; but it is seldom entered on any other days. The Banias are essentially a caste of the Southeast Punjab. On the other hand the cult of Sakhi Sarwar, "chiefly worshipped

Ibidem, § 382.

by the Gujars and Rajputs", is apparently dis-

sociated from Shaivism for its great festival is held on the Salono, in the southeast of the Province, and this festival falls on the 15th of the light half of Sawan, a day not apparently devoted to Siva, for it is auspicious for the conseration of amulets, or rakhis, which are then put on. Brahmans and Bairagis take the offerings to Vishnu, and there would not appear to be any Shaiva Brahmans in this part of India, though they exist elsewhere, one of their number having founded the Jangam sect.

The Jogis.—Jogi Pir is returned by 571 Sikhs as their sect. This can only mean that they follow the Jogi-panth. The 18 more are returned as disciples of Gorakh-Nath and 86 as followers of Gopi Chand.† But this is hardly orthodox Sikhism for the Janm Sakhi of Baba Nanak represents him as rejecting the

Migrations of the deotas are not uncommon in the Simla Hills.

[†] The Legend of Raja Gopi Chand is given in Volume II, Temple's Legends of the Punjab, and an account of two variants by Dr. G. A. Grierson in J. A. S. B. 1885, pages 35-55.

influence of Gorakhnath whom the Sikhs hold to be the disciple of Machhind, Machhendra or Matsyen-Trumpp's Adi-Granth, Introduction, page xxxvi.

dra-Nath, a fabulous being, half man, half fish. Historically no doubt Gorakhnath flourished long before Bawa Nanak was born. Yet some of the Sikhs themselves believe that Gorakhnath never died, indeed he still leads

North Indian Notes and Queries, 1894, § 242 (by Mr. W. Crooke).

a roving existence-and so was contemporaneous with Nanak. In Rohtak the Kanphata Jogis hold that Gorakhnath was a contemporary of Salivahana (circa A.D. 78) and, according to the Jogis of Hardwar, Matsyendranath is connected with very ancient Hinduism, for he was a son of the Rishi Bhrigu, but as he was born in an inauspicious moment, the astrologers said he must not be allowed to live. Cast into a river the child was devoured by a fish, but Mahadev and Parbati heard its cry and rescued it. Hence the boy was named 'Lord of the kingdom of the fish' and founded the Jogi sect. Soon after Mahadev sent a Siddhu or saint to Matsyen-

dra, and on his way the saint found some Gujar women lamenting a youth who had just died. The saint gave up his soul to restore the youth to life, and the latter became the disciple of Matsyendranath, who called him Gorakhnath or 'protector of kine,' for he came of the Gujar race.

There is nothing however in this animistic legend inconsistent with Sikhism and possibly these fol-1bidem, § 257. are actually Sikhs in a wide sense of the term. It is not easy to make out from

are actually Smith a wide season of the Granth, or from Dr. Trumpp's translation of it, what the attitude of the Gurus was towards the philosophy of the Yoga. Prahlad Rai indeed speaks of them ss Kan-phatta or ear-cropped, and as on a level with Turks, but in some passages of the Granth the practices

Trumpp's Adi-Granth, page cavi. Ibidem, page 364.

of the Yog are commended. Thus the Jogis practise physical purification

(nivali or niuli), as a preliminary to drawing in the breath. The Nirmala's name appears to be derived from a similar rite. The practices of drawing in, retaining and expelling the breath are parts of the yoga and are in culcated in the Granth.

The animistic elements in the logi creed appear to be strong. Each chela or disciple receives the name of a plant or Punjab Notes and Queries, 11, \$5 562, 964, 245 Punjab Notes and Queries, 11, §§ 562, 904, 245 flower, which he bears for life, and at marriage the bride and bridegroom are made, in Bombay, to stand face to face

in platters of palas (butea frondosa) leaves. Jogi is a title of snakes, like pandit is of parrots, and Jogis in the Punjab are said to eat snakes. Both Hindu and Mohammadan Jogis take the offerings made to Guga Pir, the snake-

god, and wandering Jogis keep snakes. Fuller information on these matters is however essential before we can draw any final conclusions as to the origin of the sect. Probably the Jogis represent the priests of Siva, who perhaps embodies many pre-Brahmanical local gods, but on this foundation have been super-imposed many mystic and philosophical tenets.

logi, as a caste, is returned by no less than 66,011 souls in British Territory, and by 8,811 in Native States, and nearly Table XIII, Part I-A, page xiii. half are females, so that the logi caste

is not very celibate. These figures unfortunately include the Rawals, a title given originally to the chief priest of a temple, but now apparently used generally by a separate caste, possibly an off-shoot of the Jogis, who are famous itinerant eye-doctors, travelling over most of Western Europe in that capacity. The Jogi too is a practising physician and magician combined, for he has the power of turning copper into gold. This faculty was acquired by Dina Nath Jogi in the time of the slave Emperor Altamsh and Dina-Nathi mohars are still said to be found, with the names of Altamsh and Dina Nath both stamped on them.

The organization of the Jogis as a caste is obscure. They intermarry with Saniasis-both being Shaivas-but not, it would appear, with Bairagis. In Jhang there are said to be the usual two divisions—the Aughar, and Darshani Kan-phata, both of whom employ Pangat Jogis in lieu of Brahmans for religious and ceremonial purposes. The celibate Jogis do not, as a rule, eat with the others, but at a jagrat, or wake in honour of Shiva, all eat together. A Jogi may take food and water from, but not eat with, another Hindu. The Jogis as a body wear a long janeo of three strands, each of eight threads, of black wool. This is worn round the neck. About the waist they wear a similar thread of two strands, each of eight threads. The nadh or whistle is attached to the janeo, like the singhi or little horn of the Siddh worshippers. Those who visit the tirath at Katesar, near Dwarka, are branded on the arm with two concentric circles within a third incomplete one, the two ends

Puniab Notes and Queries, II, \$6 126, 345, 558. of which are finished off each by a circular bead. Their rosaries vary. They are made of the seeds of the badar or jujube tree, which are called Rudrakshas, (apparently Rudra's beads), and the celibate Jogis wear beads with 11 facets, those who are married beads with only two facets, while the beads with five facets are sacred to Hanuman.

Sendu Bir .- Sendu Bir is the whistling god, whose cult is found in Jammu, in the Kangra hills, and in the Jaswant Dun of Hoshiarpur, and whose whistling sound announces his approach. Sendu is apparently an incarnation of Shiva conceived of as the storm-wind in the hills, and there may be some connection between this cult and the Jogi's whistle which is worn as denoting an attribute of the god. Sendu is a malignant deity, Kangra Gazetteer, Volume 1, pages 77-8. causing madness and burning houses.

stealing crops and otherwise immoral.

The Jangams .- Only five males of this sect are returned-in Ambala-and Notes on the History of Religion in the Hima-laya-J.A.S.B. 1884, pages 55-56.
† As Akkinson says, the Jangamas are 'living in-curations of the tinga'.
Trumpp's Adi-Granth, page 210. they have possibly returned themselves as Sikhs because of the hostility of the sect to the Brahmans. They wear matted hair,

Trempp's Addrenath page 210. (possibly in imitation of Shiva),† and are Puritan followers of Shiva, under the form of a linga, rejecting the Vedas and teaching the equality of all men. A few Hindu and Mohammadan faqirs have also returned themselves as Jangamas, but the sect is probably much more numerous, especially in the Himalayas, than the figures indicate.

29. The Vaishnavas .- The number (726) returned as worshippers of Vishnu is small, even if we add to them the few followers of Baldeo and Charndas, and the Radha-Swamis, who will be described presently.

In the Adi-Granth Vishnu is constantly invoked as Hari and many passages

Twenty-one Vaishnava Hymns, Journal of the Asiatic Society of Bengal, 1884, page 70. (Dr. G. A. Grierson.)

remind one of the character of the Vaishnava hymns in which the relationship

of God to the soul is always exhibited as that of a lover to his beloved, Apparently a similar idea underlies the cult of Dulha Deo, which is found in the east of the North-West Provinces, but not apparently in the Punjab, and that of the Naushahi fagirs. Dulha

Punjab Census Report, 1892, § 138.

Deo was a prince who was

killed when a bridegroom returning home with his bride, and a story is told of Haji Pir Mohammad Sachyar that he turned fagir while still a bridegroom, and was in consequence called Naushahi. He founded the sect of the Naushahis.

Punjab Notes and Queries, 1893, § 200.

Doubtless the two cults originated in the same idea.

and the names of the god in the one case and of the saint in the other are popularly explained by the legends.

The Bairagis.—The Bairagis, or devotees of Vishnu, have however a not inconsiderable following among the Sikhs, for 522 are returned as Sewak Bairagi,‡ and to these should be added the followers of Guru Hari Singh and Gokal (75 in all), if they are the Bairagi teachers mentioned by Mr. Maclagan in section 65 of

Yet Badri Nath in Kumaon is the supreme place of pilgrimage for the Vaishnava sects.
 Yet Banda Bairagi ceased to be a Bairagi, it is said, when he became a Sikh,

his report. Only 17 Sikh Ramanandis are returned, which is a little curious, for Kabir, whose teachings greatly influenced the earlier Sikh Gurus, was a disciple of Ramanand. There appears to be an undoubted connection between the philosophic sect of the Ramanandis and the order of the Bairagis, but their exact relations are obscure. The Bairagis probably represent a very old element in Indian religion, for those of the sect who wear a leopard-skin doubtless do so as personating Nar Singh, the leopard incarnation of Vishnu, just as the Bhagauti Trampp's Add-Granth, page 98.

Roberton Smith: Religion of the Semites, page 437.

Roberison Smith: Religion of the Semites, page 437.

dance, etc., of Krishna.

The priest who personates the god whom he worships is found in 'almost every rude religion: while in later cults the old rite survives at least in the religious use

of animal masks, 'a practice still to be found in Tibet.

The Bairagis further have a sect called the Nimbarkis. Now the orthodox Psychological Tenets of the Vaishnavas, J. A. S. B., 1864, page 108. Nimbaditya, who founded the sect, is that he was so named because he once stopped the motion of the sun on the top of a nimba tree. He also promulgated an abstruse theory of the Dualistic Aduality of the soul. But the popular idea of the Nimbarkis is that they reverence the nim tree because their deota is incarnate in it. The Nimbarkis seem to be the same as the Nima-nandi or Nima-Khark-Swami, mentioned by Mr. Maclagan, and it may fur-

Punjab Census Report, 1892, pages 123 and 114 (foot-note).

Nath is given as one of the twelve disciples of Gorakh Nath. The facts may point to the existence of a sub-sect, worshippers of the nim tree, upon which the philosophical doctrine of 'Nimbarka' was grafted.

Ramanand founded the Ramawat sect, whom he called Ava-dhuta because Notes on Fulsi Das, by Dr. G. A. Grierson, Indian Antiquary, 1892. his followers had 'shaken off 'the bonds of natrow-mindedness. To this sect belonged Tulsi Das, one of whose works was the Vairagya-Sandipani or 'kindling of continence.'

- 30. The Radha Swamis.—This sect, alluded to by Mr. Maclagan on page 120 of his report, appears to be increasing its following, though very slowly. An account of its tenets obtained in Ludhiana from the present spiritual head of the sect at Allahabad is given below:—
- (1) Radha Swami is the real name of the Supreme Creator. This holy name may be briefly explained as follows:—
- briefly explained as follows:—
 If the faculty of hearing is sufficiently developed, all force currents could be heard as sound. The Supreme Creator evolved this creation by his spiritual currents. Spirit force is the force of attraction, love and intelligence or intention. Like other forces in its creative action, it acts by focus and currents emanating therefrom. The sound in articulate speech of the spirit-current is Radha, and that of the spiritual focus or reservoir is Swami. The name Radha Swami is accordingly held to be the true and real name of the Supreme Creator, and its sound, which resounds in the inmost quarter of all regions, can be heard by a devotee of the Radha Swami sect when the faculty of hearing inherent in his spirit is developed by the process of devotional practice prescribed by the Radha Swami faith. This name was given out by Radha Swami, the Supreme Creator himself, when He made his advent in this world as a Sant Satguru or True Supreme Guide and Preceptor in human form.
- (2) As in the state of somnambulism, all the functions of body and senses are performed from a plane higher than that which the soul occupies in the wakeful state, so all the actions of the incarnation of the true creator are regulated by the currents coming direct from the Supreme Being himself. The licarnation of Radha Swami Dyal manifested himself at Agra and gave out religion in 1861 A. D.
- (3) Exaltation of the spirit by the aid of the spiritual current, which is perceived as sound internally to the pure region of spirit, which is the only true abode of perfect emancipation and salvation, constitutes the devotional practice of the Radha Swami faith. Service of the incarnation of the Supreme Creator when He manifests himself as Sant Satguru, and love for Him are indispensable adjuncts for the performance of the devotional practice mentioned above. Nay, they constitute the factor of the devotional practice itself. Unaided by the Sant Satguru who has access to the astral and higher planes, the devotional

practice of sound and spirit cannot be properly performed. No ritual or other outward ceremonies are enjoined by the Radha Swami faith. The practice is to be performed in a secluded place wherever it is available.

(4) Human actions which tend to or result in the increased concentration or exaltation of the spirit force constitute true virtue according to the Radha Swami faith, while those effecting the opposite results, vis., diffusion and degradation of spirit into lower natural regions are vice.

The moral code of the Radha Swami faith for the regulation of worldly affairs is that you should act as you would that others should act towards you.

(5) This religion has considerably expanded during the last 10 years, and a large number of educated people have joined it.

(6) This religion professes to be based on purely scientific grounds and nothing is to be accepted which cannot be comprehended by facts, natural laws and phenomena observable in this world. Nothing is to be believed as hearsay or blind faith. Mere theoretical comprehension of the principles is not aimed at, their experimental realization is especially laid stress upon. Unless the spirit can, at the will of the devotee of the Radha Swami faith, leave the body and reach the highest spiritual spheres, his devotion has not resulted in the attainment of the object in view. According to the Radha Swami religion there are three grand divisions in creation; the highest is purely spiritual, and called the region of mercy or Dyal Des. The second is spiritual material, i.e., in this division spirit predominates and matter in a very fine and pure form is mixed up with it. It is called Brahmand or the region of universal mind. The third or the lowest division is known as the material spiritual region (pinda) i.e., the region of individual mind and desire. Matter in this division is coarse and predominates over spirit, whose action is feeble and never manifests itself unless through material covers. Each grand division has six sub-divisions. Their correspondence is to be found in the human frame which represents, on a small scale the whole creation. The six sub-divisions of the lowest region (pind) are to befound in the human frame, as the six ganglia on revrous centres converge, and which is known as the piennial gland. The other 4 ganglia are in the throat, the heart, the navel and the reproductive organ. Similar ganglia, of which the above six are reflex images, are to be found in Brahmand. The grey matter of the brain comprises these six centres, and they correspond with the six spheres of Brahmand. The purely spiritual region corresponds with the white matter of the brain and six centres are to be lound therein, which correspond with the white matter of the brain and six centres are to be lound therein, which correspon

No caste prejudices are observed by the Radha Swami faith. The only conditions required for embracing the Radha Swami religion are abstinence from meat and animal food and liquor and all intoxicating drugs and a conviction that the goal of the Radha Swami faith is the only true goal of true and perfect salvation. Animal food generates outward activity and energy, and as such is detrimental to the inward concentration and exaltation of the spiritual current to secure which perfect quiescence of thoughts and outward activity is indispensable. Intoxicating drugs affect the nervous system and disturb their calmness and serenity which are necessary for the proper performance of the spiritual practice prescribed by the Radha Swami faith.

All the extant religions have for their goal the spheres comprised in the second grand division or the spiritual material religions and are subject to decay and dissolution, because matter is mutable and regions subject to its influence, however subtle it may be, sooner or later undergo change.

These goals or spheres are not clearly mentioned in the tenets of the extant religions, but allusions and hints about them are to be found in their holy books. One initiated in esoteric teachings can only comprehend those hints and is aware of the location of those spheres. But such adepts, if any, are very rare, and only those initiated in the Radha Swami faith can at present understand the esoteric teachings of all other religions also and form a correct idea of the attitude of each. The followers of the various extant religions do not know the goal of their own faith nor the comparative worth of the various religions. In the Radha Swami faith it is also a part of the tenets that the comparative value of the various religions should be clearly understood and with this object the holy books of the Radha Swami faith contain a short description and an examination of the tenets of other religions.

The doctrine of the transmigration of souls is held by those of the Radha Swami faith, Its theory is that the faculties developed by the exercise of the various functions of a spirit entity are engrained in the astral or subtle environments which accompany the spirit at the time of death and they regulate its future birth.

The founder of the sect was succeeded by Rai Bahadur Salig Ram, a retired Government official, who died about 1895, after three years of leadership.

The sect numbers about fifty in Ludhiana and has a few followers in Hoshiarpur, Gurdaspur and Delhi, according to the Ludhiana report, but from the census returns it has a much larger following, for 473 adherents are returned among the Sikhs alone. The sect teaches doctrines [see clause (6) above] which are not unlike the yoga theory of

Trumpp's Adi-Granth, page 472.

the six spheres, which are the pelvis, the organ of generation, the navel, the heart, the throat or neck and the head, which has at its crown the vent of Brahm through which the soul escapes. Through these six spheres the Jogis profess to draw the breath up and thus become absorbed in Brahm, whilst living.

31. The Sultani Sikhs.—The total number of Sikhs returned as Sultanis in the Punjab in 1891 was 34,789. In British Territory alone it is now 61,625 and this large increase is, I am afraid, due to the fact that 'Sikh-Sultani' was given as a specimen entry of religion and sect in the instructions. This mystepone of the property of the property of the section of the section of the fact that 'Sikh-Sultani' was to former Census Reports, but the subject is apparently inexhaustible, and I add a few stray facts in the hope of stimulating fuller enquiry. It cannot be beyond the bounds of possibility to solve an enigma like this, but the fullest information as to the facts is a necessary preliminary. The cult of this saint is widely spread. There is a khangah to him at Nahan, and in Saharanpur he is worshipped by a sect of Jogis called Far Yai's (sic), who are initiated by their clansmen at the age of 10 or 12. The ceremony of initiation is said to be simple, for the parents of the boy merely place some sweets before the Jogi who is their religious guide, and the latter offers them to the saint,

North Indian Notes and Queries IV, 190. after which they are eaten by the Jogis

present. The boy then learns the song, which describes the attempt to convert a bride to Sikhism and its consequences, for Sakhi Sarwar commanded Bhairon to punish the evil-doers, who at once became lepers and blind, but they were cured again at the bride's intercession. Yet there is no real hostility at present between Sikhism and this sect, and I have known of a gift of land being made by a Sikh Jat to the shrine at Nigaha. There is clearly some close connection between the worship of Bhairon and this cult, for there is an image of the god at Nigaha. Again Bhai Pheru, (whose wife was Devi), the numen in the small whirl-winds so common in the Punjab, is represented as a disciple of Sultan Sarwar. The shrine is approached by a defile, at whose entrance is a cliff some 80 feet high, called the robber's leap, (chor-i-tap), because a thief when pursued threw himself over it, rowing if he survived to sacrifice a sable heifer to the saint. He escaped unscathed. Here we have a legend which reminds us of the Bhairawa Jhamp, the cliff at Kidarnath in Kumaun whence pilgrims used to precipitate themselves as an offering to Siva, and of the somewhat similar Bihunda rites on the Sutlej at which men of the low Beda or 'sheep' caste are lowered on ropes down a precipice in honour of Mahadev. On pilgrimages to the shrine at Nigaha, blankets of black—the colour of Shiva—are worn. In the east of the Punjab, at least, the cult of Sakhi Sarwar is peculiarly favoured by women, which is consistent with its connection with Bhairava, the earth being the emblem of fertility, and this again is in accord with the somewhat Paphian rites observed at the shrine itself. Further the theory that the worship is really one of the earth-god would account for its being essentially the cult of the Jat peasautry.

32. The Nanak-panthis.—The disciples of Nanak and his numerous spiritual descendants now number 297,238 souls in all, so that we may say that this form of Sikhism claims less than three-fourths as many adherents as the Khalsa, or zealot sects of the militant Guru Govind Singh and his successors, but the Sikhs of Guru Nanak have probably been greatly under-estimated and many of his followers doubtless were returned as Hindus, as occurred in 1891. The total number returned as Nanak-panthis is now 206,450 persons or only half the number returned in 1891, but without figures for Hindu Nanak-panthis it

is impossible to say how far the decrease is real. Whether the followers of Baba Bedi Sahib and of Guru Khem Singh are personal adherents of the present influential head of the Bedis I cannot say, but judging from the Districts in

which they are returned they probably are.

The Udasis.—Though founded by a son of Guru Nanak only 401 Sikhs are returned as Udasis by sect, but 4,213 Udasis are shown as Sikhs by religion. The Udasis should perhaps be regarded as a single sect divided into those who wear the jora or top-knot, refrain from smoking, and so are in a sense Sikhs, and those who wear no jora, but only use water drawn by a dur or rope in a lota or brass vessel, and who may smoke, and are thus Hindus (Jhang). The Sikh Udasis are said to be divided into two great orders or divisions, viz., the great and little akharas. The great akhara comprises four dhunas or sub-orders, founded by four disciples of Gurditta, the son of the sixth Guru, Har Gobind. little akhara was formed

Phul Sabib Balu Hasna Alwast Sahib. Govind Sahib.

Cf. Punjab Census Report, 1892, § 90.

from the followers of Sangat Sahib or Bhai Pheru. To the Udasi figures then should probably be added 14 persons returned as Manohar Dasi, in Amritsar. Both these akharas are distinct from the Bhagat Bhagwans, founded by Phagatgiri, a Saniasi who met Har Rai, the seventh Guru, on his way to Jawala Mukhi and was by him sent to Dharm Chand, the grandson of Nanak, who converted him, but he continued to wear the jata, or matted hair, and to smear his body with ashes, whence the Udasis retain those customs. All the Udasis save those of the great akhara

appear to be called Bakshishon ke Udasi, or 'Udasis by graces.'

But there are various other Udasis such as the Ramdas-ke, founded by one Guruditta (not the son of the sixth Guru), the Mian Sahib-ke, founded by a follower of the ninth Guru, and the Diwana Udasi, as to which sects or subsects I have no information. Regarding the Nangi-panth, which is apparently a sub-sect of the Udasis, the following notes may be given:-The sub-sect was

Indian Antiquary, XIII, 1884, page 1.

founded by Dedraj, a Brahman, about

by Baba Manohar Das, with the aid of Maharaja

Narendra Singh of Patiala,

A.D., who had two wives, a Baniani, and after her a Brahmani, both named Nangi, but the second wife alone gave the sect its name. Its followers are found in Ihaijar, Narnaul and at Bhiwani in Hissar: they profess monotheism, have no caste and no concealment of women. Their hymns are mystical in character, and the airs of some musical merit.

The Suthra-Shahis.—A boy was born with its teeth already cut and its parents exposed it, as a child so born is unlucky. The tenth Guru Har Gobind, happened to find it alive and told his disciples to take up the child, but they refused, saying it was kuthra, or dirty. The Guru replied it was suthra or clean and they then obeyed. This boy was the founder of the Suthra-Shahi sect.

The story is noteworthy as showing how unlucky children were exposed or possibly given to faqirs. The poet Tulsi Das was born in Abhukta-mula at the end of the asterism Jyeshtha and in the beginning of that of Mula, and he was in consequence abandoned and probably picked up by Sadhus.

Indian Antiquary, 1893, page 265.

Jogis, as we have seen, according to one legend

originated in a similar way, and the Sansi Jats account for their name by a legend which says that their ancestor was given to a Sansi, the first person who came to the house after

Lepel Criffin's Punjab Rajas, page 3. with the orders of the Brahmans and astrologers.

his birth, in accordance The Suthra-Shahi, like the Jogi, wears a janeo of black wool. Their apho-

am informed that Budha, the disciple of Nanak, only lived till the time of the

Baba Budha. Bhana. Sravan. Guruditta. Ram Kaur.

sixth Guru, and that his descendant, Ram Kaur (surely a woman's name), was made a disciple by the tenth Guru and by him named Gura Baksh Singh, but 136 followers of Sahib Ram Kaur are now re-

turned from Gurdaspur, none being returned as followers of Guru Baksh Singh. The village of Ramdas in Amritsar was named after the grandfather of Budha, not after the Guru, and orthodoxy denies that the Baba was concerned in the theft of the emperor's horses, Bidhi Chand, who appears to have 14 followers, mostly in Jullundur, having committed that offence.

Baba Mula .- Baba Mula's followers have fallen from 610 to 5 among the Sikhs: all five being in Delhi. This is doubtless the Baba Mula who was the chela of one Siga Ram, a Brahman, and a Sikh of the fourth Guru. No adherents of the Khatri, named Mula in Sialkot, have been returned. Baba Mula was never a patron of the Phulkian houses.

Manji Sahib .- No 'worshippers of the bed' are now returned unless the entry of Sunchi-manji or Punjab Census Report, 1892, § 93. 'the true bed' relate to

this doctrine. The worshippers of the manji are not a sect, and the term merely originated in the practice of the Gurus of delivering their discourses on a bed, or manja, while their selected preachers sat on a small bed or manji. Thus the grant of a manji was equivalent to appointment as an apostle or deputy. The third Guru made twenty-two such grants, but eventually the practice was discontinued, no more deputies being appointed, and, as only the authority of the Granth Sahib was recognized, it alone is now placed on a manji. For the manja or manji the sixth Guru substituted the takht or throne. The manji itself is not, or ought not to be, an object of worship, and the entry would appear to mean simply a follower of the doctrines of the Granth.

The Chawal Shahis.—There is a single entry of this sect, if sect it be, in Dera Ismail Khan, and presumably it refers to the cult of Sanwal Shah, an Arora of the Chawala or 'Rice' section. Sanwal Shah has 120 Sikh followers in Mianwali and (strange to relate of a follower of the Sikh Gurus, who was himself appointed a guru), he has idols of stone in Bahawa lpur, unless the Sanwal Shah referred to in paragraph 13 above be a different personage.

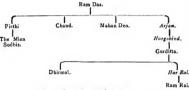

The Satis and Sat-Sahibis .- It is impossible to say what sect these names represent. The terms probably mean nothing more than 'orthodox' or followers of the 'Sat' or true Guru. Sati could hardly mean 'worshipper of a satti,' though the worship of those who have been burnt alive on a funeral pyre is by no means uncommen. The Sat-Gurus and Sat-Sahibis, some 381 souls in all, are mainly found in Hoshiarpur, while the 488 Satis are widely scattered.

The Ram Raias .- This sect shows but a small decrease in numbers among the Sikhs, returning 25,000 as against 27,000 in 1891. It has a large following in Ludhiana, Ambala and Hoshiarpur, but the centre of the cult is in the Dehra Dun, where there are several shrines served by Udasis. This Guru appears yearly as a fly to his followers. When alive, one of his adherents was at sea and in danger of shipwreck, so the Guru left his body and went to his aid in the form of a fly. Having saved the vessel he returned, but found that meanwhile his body had been cremated. Hence cremation is observed by his

Himslayan Gasetteer, II, page 840.
his Udasi followers). His

festivals are held on Chet 5th and Bhadon 8th, and are chiefly attended by Sikhs from the Punjab. Every year a new pole is cut from the Siddh-ban (or sacred wood), bathed in Ganges water and set up in place of the old one for the Guru's standard. The Ram Raias, I am told, acknowledged the 6th, 7th and 8th Gurus (Hargobind, Har Rai and Ram Rai), but not Har Kishen, Tegh Bahadur, or Govind Singh.

The sect is, genealogically, connected with the Dhirmalias, for Dhirmal

Punjab Census Report, 1892, § 102.

was the elder brother of Har Rai, the father of Ram Rai, according to my information, and though no Sikhs are now returned as Dhirmalias, a considerable number of Sikhs are returned as followers of 'Guru' Bagh Singh, who must be the Baba Bar Bhag Singh, a descendant of Dhirmal.

33. The Sikhs of Guru Govind Singh.—Of those Sikhs who returned their set 419,793 persons or 51'5 per cent, are recorded as Sikhs of Guru Govind Singh or his successors, so that if these alone are to be regarded as true Sikhs, our returns would appear to show nearly twice as many Sikhs as they ought to do. It is, however, certain that many Govind Singhi Sikhs have returned no sect at all. Thus in Amritsar out of 264,329 Sikhs only 20,000 are recorded as Sikhs of the great Guru, but the numbers must be in reality many times greater.

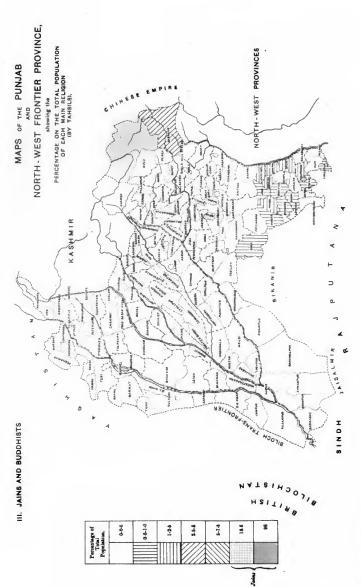

As to the tenets of Guru Govind Singh, I have nothing to add, save what has been said in paragraph has been said in paragraph 18 above, to Mr Macla-

gan's account, but it may be noted, in connection with the Guru's retention of the worship of Devi, that the truth of the story that the Guru was directed by the goddess to offer up the head of a disciple is denied by one school of Sikhism, and the true version is said to be that the Guru said:—'He is my beloved disciple who gives one his head,' whereupon five men, now known as the panch piyare or 'five beloved' offered him their heads. In the latter case the story is possibly to be ascribed to the older myth that the five Siddhs offered their heads to Devi and cutting them off piled them in a heap, whereupon they became stones.

The Akalis or Nihangs.—The Akalis are the followers of the immortal Being, akal purkh, and did not originate, I am told, with Ajit Singh, though who their founder was I cannot say. They retain the blue dress, which used to be worn by many Sikhs after the Guru, Govind Singh, wore it as a disguise when fleeing to Machhiwara in Samrala Tahsil; but they only adopted the peaked turban after the time of the Gurus, when it was invented by Nihang Naini Singh to serve as a standard and leave the hands free. The term Nihang is not confined to the Akalis, for it is used of Mohammadan saints, e.g., of Shah Sadiq Nihang in Jhang.

The total numbers returned as Sikh Akalis or Nihangs is now only 431 as against 1,376 in 1892, but to these should be added 136 Akalis by caste. Of these numbers 457 are males and only 110 females. The sect indeed appears to be dying out. It may be added that Akalis eat meat,—indeed an abstainer from meat is not a true Akali—though they abstain from spirits.

The Kukas.—The Sikh Kukas now returned number 13,788 in British Territory alone. In 1891 they numbered 10,541 throughout the Province. I 136

have included the followers of Guru Ram Singh and the Namdharis in the above figure, as they are undoubtedly Kukas. Of the 10,331 who return themselves openly under that term, Sialkot returns a fifth (2,180), and Gurdaspur, Amritsar and Ludhiana each over 1,000. In Jullundur the return shows 2,443 followers of Guru Ram Singh. The Namdharis are most numerous in Sialkot.

How far these figures represent an actual increase in the sect, I cannot say, Orthodox Sikhism is opposed to the Kuka practice of dispensing the amrit to each man in a separate vessel, as it should be given to all in one vessel: and to the Kuka frenzies. The Kukas reverence Ram Singh as the twelfth Guru, and also invoke Balak Singh, which is again opposed to the Sikh doctrine whereby only ten Gurus are recognized. Further they object for some reason to blue clothes.

34. The Ramgarhia Sikhs.—The figures show 4,253 Sikhs returned as Ramgarhias, chiefly in Gurdaspur and Amritsar. There are Tarkhans, followers of Hardas, a man of that caste who became a disciple of Guru Govind Singh, and

Lepel Griffin's Punjab Chiefs, page 170.

whose descendants founded the famous Ramgarhia

misl. Strictly speaking the term should be confined to the descendants of Hardas, who still hold substantial jagirs in Amritsar and Gurdaspur, but the term has been adopted by a large number of Sikh Tarkhans, just as many Sikh Kalals have adopted the term Ahluwalia, the title of a particular family of that caste, as their caste-name. But the Ramgarhia are not all Tarkhans possibly, for there is a group of Kalals also which goes by that name.

35. The Jains .- The Jains in these provinces now number 50,020 souls, or 9'5 per cent. more than in 1891, and of these only 37 are returned in the North-West Frontier Province, the Jains being chiefly found, as the map opposite this page shows, in the South-East of the Punjab. The above total includes 7,238

souls in the Native States. The Jains are found mainly in the Districts noted in the margin, but Maler Kotla State, Hoshiarpur, Ferozepur, and Lahore also return over 1,000 Jains. Jind State shows the greatest apparent increase, as in 1891 it only returned 173 Jains, and Amritsar also has twice as many as in 1891, but in

Patiala and Ferozepur the numbers have decreased. There is a slight tendency for the Jain community to spread in the Central Punjab, but no members of the community are returned in the Buddhist tracts and very few from the trans-Indus Districts.

The Jain sects by caste.—Reading the accounts of the Jains in former
Census Reports one can Punjab Census Reports, 1883, § 257: 1892, § § 121-125. hardly

Jains have some complicated system of cross-divisions by caste and by sect as to

water over the stone to show that all connection with the deceased has been severed. The Khandelwal also appears to be a religious or sectarian cross-

Sirsa Seitlement Report, 6 88,

Ibbetson considered, the Oswal Banias are gen-erally Swetambara, and the Agarwal invariably Digambara, by sect. The Agarwal sub-caste of the Banias is also, according to one of my notes, called Bishni, and its name is said to be derived from aggar, i.e., the janeo or sacred thread, not from Agroha. Further information regarding this caste will be found in Chapter VIII. The Khandelwal Banias are also Swetambara by sect. They have, in Gurgaon, a curious custom at funerals, for they place one stone upright and another on top

division of the Brahmans, which in Sirsa forms a Brahman sub-caste. They were separated from the Gaur Brahmans at the time

of Paras Ram's great sacrifice and derive their name from khandan to divide. The Jain sects .- The Jains, as a body, have a remarkably complete historical and religious literature which has been, or is being, thoroughly studied by German scholars. Unfortunately the results are hardly yet available in a form intelligible to any but specialists. Further the Digambara tenets, which are of great interest, are also contained in an extensive literature, but as their pandits preserve the old-world hostility to printing, little has as yet been published

regarding them.

To make clear what follows it should be noted here that the Jains have 24 semi-divine linas, whose series ends with Mahavira, (Mahabir, 'the great hero'), and a subsequent succession of human teachers, called suris, a term we may translate by 'pontiff.' Of these the first was, according to one sect (that of the Kharatara gachha), Mahavira himself, and his first disciple was Gotama, who did not however succeed him, Sudharman becoming the second pontiff. The other sect, the Tapagachha, regards Sudharman as the first pontiff. Both these sects trace, though with some differences, the pontifical succession down to Uddyotana, who founded the 84 gachhast of the Jain (? caste) which still exist, and was 38th in succession from Mahavira.

After the time of Uddhyotana there are two distinct lines of pontiffs. One, reverenced by the Kharatara-gachha, is a succession of pontiffs who all, (with the exception of Abhayadeva who was a leper), bear the title of Jina;. The other, accepted by the Tapa-gachhas, bears various titles, and was founded by Jagach-chandra, 44th in succession, according to the Tapa-gachha records, from Sudtarman. These two historical gachhas or sects of the Jains have apparently been lost sight of in the maze of sects and orders into which the community has become divided in more recent times.

‡ Probably as re-incarnations of the Jinas or Arhats. The Tapa-Gachhas by denying to their pontiffs that title may algoify their rejection of the doctrine that they re-incarnate the Arhats.

Bishni. – Vaishnava. Between the Ghaggar and Jumna rivers the Agarwal have two divisions, Bishni, i.e., orthodox Hindus, and Jaini or Saraogi, a sect which worships Parasnath. There is, or used to be, a difficulty about intermarings between those two sects. (Cf. Siras : estlement Report § 89).

[†] These include the Khandewal, Agarwal, Srimal, Vanswal or Oswal of gots," or gachhas according to Wilson Religious Sects of the Hindus, page 345.

The main divisions of the Jains which concern us are those of the Digambara, or naked, and the Swetambara, or white-clad, sects. Their origin is very obscure. According to one account the former sect was founded by Nataputta Nirgrantha, (or Nigantha), who has been identified with Mahabir himself. Indeed it has been held that Mahabir only reformed an ancient order of naked ascetics. According to the Kharatara records the Digambaras arose in the time of the 18th pontifi. Chandra, whereas the Tapa-gachha account is that the name of the Nir-grantha sect was changed to Kotika-gachha as early as the time of the 19th pontifi. It thus seems

9th pontiff. It thus seems likely that the Digambaras likely that the Digambara represent an older phase of belief than even Jainism itself, but, however this may be, it is certain that in the time of Bhadrabahu, the 27th in suc-

cession from Gotama, the Digambaras and Swetambaras had finally separated. The Digambaras forth-with split up into various sects or rather orders.

The Digambara orders.—The successor of Guptigupta founded the great order of the Nandi Sangha, sakha, or school, which from its importance appears to have overshadowed the three minor orders founded by his other disciples, and which is, it would seem, often regarded as co-extensive with the whole Digambara sect. These four orders were thus designated:—

Order. Synonyms, Founder. Maghanandin, who observed Nandin,‡ Parijata* Gachha. Kirtti, period of the rainy season under a Balatkara† Gana. Chandra, Bhushana. nandi tree, (Cedrela toona). Vrishabha: who ob-Pushkara Gachha. Raja, Bhadra, Surastha Gana. served it under a II.-Sena Sangha Vira, Sena. (Vrishabha Sangha). Jinasena or sena Chandra-Kapata Simha, Asrava, Simha; who ob-served it in the III .- Simha Sangi Gachba Kanura Gana, Khumbha, Sagara, cave of a lion. Pushtaka Gachha, Dewa, Naga. Dewa: who served it in the IV .- Dewa Sangha of house the courtezan Deva-Desi Gana. Datta, Langa. datta.

The Digambaras insist strongly on the essential unity in matters of doctrine and observance between all four orders, whose members alone can consecrate images. Collectively these four orders appear to be known as the Saraswati gachha, though perhaps that term is in strictness only a synonym of the Nandi Sangha. So too they appear to be called Kundakundanwaya, or 'the line of Kundakunda,' their fifth pontiff. In some obscure way the three minor orders would seem to be subordinate to the chief order, the Nandi Sangha, as they all four owe allegiance, it appears, to the same pontiffs.

Later sects.—Subsequent to the rise of these four orders or sakhas, there arose four other sanghas, vis.: the Mula, Kashtha, Mathura and Goppa Sangha. But Mula Sangha means literally 'the Original Communion,' and the term is also used of the whole Jain community and of the Digambaras before they spilt up into sects.

Parijata is the name of the celestial tree, and also of the coral tree (crythina indica).

[†] The 'powerful' order, ‡ Strictly speaking then these titles are confined to the Nandi order,

Still later there arose various panthis, such as the Visa-, Tera-, Gumanaand Tota-Panthis, i.e., those who worship a book (pustaka) in lieu of an image.
And again it is said that, in Sambat 1709, Lavaji of the Lumpaka sect, together
with one Dharmadasa, a cotton-printer, founded the mouth-covering Dhundakas.

These divided into 22 sections (presumably the

Indian Astiquery, 1892, page 72.

Bais-tola), one of which was called Dhanaji.

Dhana's disciple was Bhudhara, and the latter's disciple Raghunathji, whose disciple Bhishma founded the Terapanthis or Mukhabandhas (mouth-coverers.) Whether these sects are confined to the Digambaras or not I cannot say.

But even these do not exhaust the list of sects. The Kharataragachha records enumerate ten gachhabhedas, the last of which was founded as late as Sambat 1700, but whether these still exist or not I cannot say. Indeed I do not know if they are sects or orders, or merely theological schools. The Tapagachhas also have various divisions, such as the Vrihad- or Vada-, (Vata) gachha, so called because Uddyotana consecrated Sarvedevasari, or, according to some, 8 surris, under a large fig-tree; (vata).

The Jain tenets.—The Jain Jinas, Tirthankaras or Arhantas were 24 in number each having his separate chinha or cognizance and being distinguished by the colour of his complexion. Images of one or more Arhantas figure in every Jain temple. Thus Risabha-Natha or Adinatha has as his cognizance the elephant, Sambhava has the horse, Sumati the curlew, and other Arhantas the lotus, the swastika (doubless a sun-symbol), the moon, a crocodile, the sviratsa (like a four-leaved shamrock in shape), a rhinoceros, a buffalo, a tortoise, or a boar. Parasva-Natha's cognizance was the hooded snake, (shesha-phant), and that of Mahavira, the last of the Jinas, a lion. These two latter, with Risabha-Natha, are the most widely worshipped, and next to them come Santi (the anțelope), and Nemi (the blue water-lily). To what primeval cults these jinas may point one can hardly conjecture.

It is easy to point to the resemblances between Buddhism and Jainism. Apart from mere religious phraseology, which tends to be the same in every religion, Buddha was often called Jina, 'the victorious': his death was the nirvana: both Buddhists and Jains also employ the swastika or satya as a sacred Indias Audquary, 1873, pages 14, 134, 354 symbol: the Buddhists also have or had

Further the Jains indicate South Bihar as the scene of the life and labours of nearly all their Tirthankaras, as it was of Buddha's, and Maharira is said to have died at Pawa, to which place also Buddha's death is assigned. The colossal statues of the Jains also resemble those of the Buddhists.

The Jain ritual is exceedingly complicated, but it has few features of interest. Their places of pilgrimage are five in number, viz., Satrunjaya, Parasnath, in Bihar, Mount Abu, Girnar, and Chandra-and IX, 1880, page 140.

giri in the Himalayas. The oldest Jain

remains are probably at Girnar, a hill also sacred to Buddhists and Hindus (cf: paragraph 15 supra). Their holy seasons appear to be peculiar to themselves, but the observance of the rainy season as a sacred period of the year is also characteristic of Buddhism.

It is not at all easy to say in what points the Jain doctrines diverge from those of the Hindus, but apparently the chief differences are that the Jains repudiate the Vedas, and disavow the authority of the Brahmans. In other words they represent an element of Hinduism which never submitted to, or at an early period revolted from, the quasi-social supremacy of the Brahman castes, and in this they have much in common with the Buddhists and Sikhs. They also resemble the latter in having a line of spiritual teachers whom they reverence to the more or less complete exclusion of the Brahman.

The Jain caste.— In all 2,653 souls, chiefly in Hoshiarpur and Lahore, are rememed as of the Jain caste. How far they constitute a true caste it is not possible to say, for the sect appears to be organized on two distinct but con-

This was a matam or mat, (monastery), founded by the Lekhaka Lunka, in Sambat 1508, and from this
mat the Veshadharas took their rise.

current principles, one based on natural descent and so on caste, the other sectarian, i.e., on the beliefs of the different sub-sects within the sect. Hence arisé cross-divisions which have yet to be elucidated. For example the Nandi Sangha or order is also called the Nandi Amnaya, but amnaya means simply kula or family, so that Nandi Amnaya means the generations of Nandi.' Gachha (with which gana is said to be synonymous) is used indifferently for the religious sects or orders, and for the natural groups within the caste there being 84 gachhas or gots, i.e., families or races, of the Jains. Whether these are in any way connected with the spiritual gachhas or not I cannot say.

36. Buddhism .- Our present figures are in curious contrast to those of

		1901.	1891.	
Kangra District Including {Spiti Labul Chamba		6,040 4,176 3,166 983	6.236 5,768 3.548 1,869 468	
Mandi Simla (Kanawar)	***	510 2,223	***	

1891, when no Buddhists were returned except in Spiti, Lahul and Chamba. the present Census Chamba has only returned 22,0 and British Lahul, which adjoins Chamba-Lahul the Buddhistic part of Chamba) 983, nearly 50 per cent. less than in 18,1. On the other hand Kanawar, which

is quite as distinctly Tibetan and Buddhistic as Lahul, now appears to have returned Buddhists for the first time, while the Mandi State returns 510, two fifths of whom are females. In the latter a gon-pa or Buddhist monastery has, within the last few years, been built at Rawal Sar, between Mandi town and Sujanpur. Dr. Vogel informs me that the principal image is that of Padma-vambhava or the 'lous-born', who also takes a prominent place in the Lahul gon-pas where he is known as Guru Rin-po-che,† 'the Teacher of Great Price,' who introduced Buddhism into Tibet. The presence of these Buddhists in the State was however solely due to the fact that the Sisu fair was held in Phagan, about the time of the Census, at Rawals:r, that lake being deemed peculiarly sacred by the Buddhists of China and Tibet. There are hardly any Buddhists resident in Mandi.

In his report on Tahsil Chini Mian Durga Singh states that the ruling family of Bashahr is, according to the Shastras, held to be of divine origin, and the Lamaic theory is that each Raja of Bashahr is at his death re-incarnated as the Guru Lama or Guru of the Lamas, whom I understand to be the Dalai Lama, of Tiber. There is also another curious legend attached to the Bashahr family. For 61 generations each Raja had only one son and it used to be the custom for the boy to be sent away to a village and not be seen by his father until his hair was out for the first time in his sixth, year. The idea that the first-born son is peculiarly dangerous to his father's life is not confined to Bashahr. Both these legends originate in the doctrine of the metempsychosis, which is prevalent in the hills of the North-East Punjab and indeed throughout these Provinces.

An account of Buddhism in Kanawar will be found in Gerard's account of Koonawar, published in 1841. His account agrees in all material points with Mr. A. H. Diack's description of Buddhism in Lahul.

ISLAM.

37. The Mohammadan population .-- As we have seen in paragraph 2 of this chapter, the Mohammadan population has increased rapidly, in comparison with the Hindu element, in the past decade. Even in the Districts and States in which it shows a decrease, we find that the Hindus show, as a rule, a far greater Subsidiary Table I. B.

decrease, as for instance in the Native States of Loha-

ru and Dujana, and in the Districts of Ambala, Montgomery, and Gujrat. On the

* 341 should however be adde to the Chambi figures as most of the Buddhists have been returned under the amm of B on Hindes in that State.

† The New Mr. Heyde gave the nime as Padmapoul (see the account in the Kengra Greetters. Part III, page 18). For Rin-pu-che see Monier Williams' Buddhism, page 284. Rin-po-che is also a title of the Dalai Lama of Lhúsa.

other hand in Nahan State the Mohammadan population has diminished by nearly a third, and in Kangra, Hoshiarpur, and Jhelum the Mohammadan population has decreased, whereas the Hindu has increased, or not decreased so fast as the Mohammadan element. In Jhelum I think emigration of a temporary character explains this falling off, which amounts to nearly 3 per cent. In the other areas

tracts, in each of which it exceeds 10 per cent.

one might suggest that the figures point to a retrogression of Mohammadanism in the Himalayan area, whose population is essentially Hindu, but in Chimba, Suket, Mandi and Simla the Moham-madans have increased far more rapidly than the Hindus, so that these local fluctuations cannot be explained. The increase in the Mohammadan population is most marked in the marginally noted

The extension of the Census Operations to the Kurram Valley has added 51,475 souls to the Mohammadan population, and the census of the Shirani country has added another 12,371. In the Biloch trans-Frontier 23,051 Mohammadans were enumerated as against 5,902 in 1891, so that the Mohammadan population of the two Provinces is now 14,141,122 souls as against 12,915,643 in

38 The Sects of Islam .- The figures given in the Subsidiary Table VI appended to this chapter are arranged in the order followed by Mr. Maclagan in his Census Report of ,892, paras. 131-147. There are but few remarks to be made on the figures, and these will be made under each sect. Comparison with the returns of 1891 is difficult as only males over 15 have now been tabulated.

1	Mohammada	n sects.		1901.	18,1.	1881.
Sannis		***	***	95 37	98 06	68.16
Shias	***	***	***	1'32	119	80
Ahl-i-Hadis	***	***	•••	č.n3	.03	'02

† Males over 15 only.

In the two Provinces the figures for the three main sects give the marginal percentages, on the total Mohammadan population, but the increase in the numbers of the Shias and

Ahl-i-Hadis is probably

not so great as these figures would indicate, because adult males are more likely to be returned as belonging to these sects than females or young children. On the other hand these figures do not include the various sects, Qadria, Jalali, Naushahi, etc.

Next to nothing has been added since 1891 to our knowledge of the Mohammadan sects in these Provinces. The Revd. Edward Sell's Faith of Islam, originally published in 1880, reached a second edition in 1896, but the author resided in Southern India, and does not even mention the Chishtis who appear to be confined to the North of India. There is however a good deal of indige-nous literature on the subject of the Mohammadan sects, but very little of it is accessible to Europeans, though the Chishtis have published more than one work on their tenets. This literature merits more attention than it has hitherto received, but it is singularly unattractive in form, and requires tne most careful use as it is, historically, inaccurate and confusing.

After describing briefly the two newest sects of Islam which have arisen in the Punjab, I shall give some notes on the Shia sect and its developments.

39. The Ahmadiyas.—The sect return shows 1,113 followers, males over 1500 in view of the approaching census, this sect adopted the designation of Ahmadiya, and our return is probably a complete one. The leader of the sect is a Barlas Mighal, whose lamily came from Persia, in the time of Babar and obtained a 1881 in the present District of Gurdaspur. Beginning as a Maulavi with a special mission to the sweepers, the Mirza eventually advanced claims to be the Mahdi or Messiah, expected by Mohammadans and Christians alike. The sect however emphatically repudiates the doctrine that the Mahdi of Islam will be a warrior and relies on the Sahih Bokhari, the most authentic of the traditions, which says the shall wage no wars, but discontinue war for the sake of religion.' In his voluminous writings the Mirza has combated the doctrine of Jihad and the sect is thus opposed to the extreme section of the Ahi-Hadis.

40. The Ditte-Shahis — The following account of a new unorthodox sect of Mohammadan origin by Lala Piara Ram, Extra Assistant Commissioner, is of interest:—

"The only religious sect requiring notice in the Gujrat District is that of the Ditte-Shahi Musa'mans. The sect is not an influentiatione, but, as it sometimes attracts attention, a brief description of it will be us fol. Ditte-Shah, the founter of the sect, was an Arain of Suk Kalan, about three niles east of Gujrat town. At the age of 40 he become a disciple of a fakir named Mian Mohammad Panah of Shekhpur in Gujrat and having given up worldly pursuits began to lead a retired life. His creed was a simple one: he exhorted people to do good actions and disregard outward ceremonials. He wore red colbes and is said to have given up the religious duties enjoined by Islam. People flocked to him in large numbers, and gave him presents, which were taken care of by his sister's son Mian Muhammad Yar. He made some disciples and died about 20 years ago. He was succeed d by Mian Mulammad Yar who is now considered the head of the sect.

There is no learned man among the Ditte-Shahis and the sett do not possess any books of the interature. They discard the ordinary religious cuties observed by Musalmans and consider Ditte Shah to be the real Rasul of God and feels on much reverence for him that others think that they believe him to be not different from God. The initiated Ditte-Shahis (Lalposh) wear red clothes and also ornaments and lead a cheerful hife. On the occasion of the antiversary of Ditte Shahis death, which is on the 9th of Bhadon, they hold a lair at his tomb in Suk Kalan, singing and dancing and expressing joy on the occasion. It a Ditte-Shahi daes his bier is accompanied by singing prities and a large contourse of people assemble. The present head of the sect is about 50 years of age, and though ultiterate is respected by all. There are also 12 or 13 other men, disciples of Ditte-Shah, who are regarded as initiated and are therefore objects of veneration.

The exact number of followers is not known but is believed to be a thousand ormore. Three fairs are held:—

- (1) Fair of Shah Khurshed held in Sialkot. This is held in the month of Chet, when Ditte-Shahis assemble at Suk and start together for Sialkot.
- (2) Fair of Muhammad Panah, the spiritual guide of Ditte Shah. This is held in the month of Har at Sheikhpur.
- (3) Fair of Ditte Shah. This is held in Bhadon at Suk where there is a tomb of Ditte Shah.

The belief among the common people is that Ditte Shah was a pious man who led a good life and was a Fakir. He und to dress at times like a weman, but was free from senruality. Whatever he received from the prople he distributed in alms. He is said to have made no disciples, but on his death a tomb was erected to lim which is looked upon with respect by the ignorant people. Amongst the orthodox Musulmans Ditte Shahis are considered to be heretics. It is said that they number about 2,000 persons. Some have actually returned themselves as Ditte-Shahi:

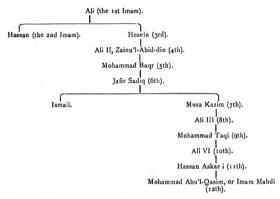

The number of this sect which appears in our returns is 7!

41. The Shias.—As in previous Censuses there can be but little doubt that our figures for Shias are considerably below the mark. The Shia is allowed, and even encouraged, to conceal his creed, if its exposure would be inconvenient. Even in Bahawalpur the Shias only amount to 3'4 per cent. of the total Mohammadan population.

The history of the Shias and of their tenets is one of the most obscure, as it is one of the most fascinating, problems in the history of religion. Its origin dates back to the earliest period of Islam and may be briefly traced as follows.

- 42. The Quraish.—The sanctity of the tribe in which Mohammad was born dates from 440 A.D., or nearly two centuries before the Prophet's power reached its zenith, in which year Koshai acquired for his family the guardianship of the Ka'bah—the four-square sacred stone at which the gazelle was sacred—at Mecca. Before the birth of Mohammad two rival factions were formed, the Hashmites and the Umawiyah, and the feud passed on from generation to generation. Mohammad was a descendant of Hashimi and his bitterest opponents were the men of the 'Imawiyah party, who after his death reopened the feud and eventually killed the sons of Ali. Thus within Islam from the earliest times there have been two great movements. The first is represented by the Sunnis, The other, represented by the Shias, rests more on Mohammad's personal sanctity, on the 'light of Mohammad', which descended to Ali and from him passed on to the true Imams, who alone are the lawful successors of the prophet. And there is a third element, the philosophical, mystic doctrines of Suñism, which has apparently influenced both movements to some extent. Moreover it is important to bear in mind the history of the Moslems in any attempt to discuss the tenets of the modern Mohammadan sects, and not to assume that all departures from the orthodox creed of Islam are due to Shia influence.
- 43 The Shia tenets .- The Usul or fundamental tenets of the Shias or 'followers' of Ali are five:—(1) the unity of God, (2) his justress, (3) the divine mission of all the prephets, of whom Mohammad is the chiel, (4) to consider Ali, the Khalif, and his descendants from Hasan to 'Al-Mahdi,' the twelve lmams, and (5) the resurrection. Of these the fourth has led to the greatest dissensions in Islam. The Shia doctrines rest on the absolute sanctity of the descendants of Ali, to whom in consequence almost divine honours are paid: the Sunnis, while respecting the house of Ali, accord them no authority, and thus the tenets of the two great sects are irreconcileable. Yet so deeply rooted is this belief in inherited sanctity that the Sunnis hold in theory, that the Khalif must be of the Quraish tribe, though in practice the rule has never been observed. This doctrine of inherited sanctity is dependent on, or at least closely connected with, the belief in the metempsychosis, and has rendered it possible for the Snia sect to admit of many developments, so that from the cardinal tenet of the unity of God was eventually evolved a system of pantheism. This was due, probably, to the introduction of the Sufi doctrines, which occurred in the second century of the Hijra, and had been preceded even then by an earlier mysticism. Derived probably from suf, wool, the term Suft would appear to imply renunciation of the world, for ascetics were always so clad. The initial inspiration (1/ham) is gained by repeating in absolute seclusion the name of Allah, until the utterance becomes mechanical, and then divine enlightenment ensues, as in the yoga. The esoteric teaching of the Sufis compares sensuality to ecstasy, and in this too has analogies in the Shaktak practices. As an organization Sufiism recognizes two grades, persons of admitted piety and acknowledged sanctity being divided into two classes, vis. :- (1) the mujas, or those who are authorized to establish bat'ut, or spiritual discipleship, and (2) the ghair-mujas or those not so authorized, who are engaged only in the amelioration of nofs or self. The Quran is valued as a divine revelation but in practice the voice of the Pir or spiritual director is substituted for it, and the murid or disciple has no further responsibility. Here again we find a resemblance to the Guru-sikhi system of spiritual relationship
- 44. The Shia sects.—The doctrine of the Imamate contained within it the germs of schism. The imamat being a light (nur) which passes (by natural

descent) from one to the other, the Imams are prophets and divine, and this heritage is inalienable. Thus the second Imam, Hassan the eldest son of Ali could resign his title of Khalif, but not his Imama which had descended to him and on his death passed by his inheritance to Hosein. Its subsequent devolution followed the natural line of descent, thus:—

In the time of Ali II, the fourth Imam, the Imamites, as we may term the Shias, formed themselves into a secret order, with a series of seven degrees, into each of which its votaries were formally initiated. This movement transformed the Shia sect or faction into a secret society, or group of societies, and had farreaching results, though at first it appears to have been merely a measure of self-defence against the oppression of the Sunni sect. It was soon followed by the great Shia schism, which arose out of a dispute as to the succession to the Imamat. Jafir, the sixth Imam, nominated Ismail, his eldest son, but on the latter's premature death he declared that Musa was his heir, to the exclusion of Ismail's children. The succession to the Imamat was thus governed by the usual rules of inheritance, the uncertainty of which has so often led to fratricide and civil war in eastern empires. The claims of Ismail were supported by one party among the Shias, despite the declaration of Jafir, and thus was founded the Ismailia sect. The other party, the Imamites, supported the claims of Musa, and this sect of the Shias believes that the twelfth Imam, Mohammad, is still alive, that he wanders over the earth, and is destined to re-appear. The Ismailians on the other hand hold that the last visible Imam was Ismail, after whom commenced the succession of the concealed Imams. And to go back for a moment the Nosairians held that Ali was the last, as well as the first, Imam, and it thus appears that the Shia sects originated, historically, in divergent views as to the personal claims of the Prophet's natural descendants to succeed to the Imamat.

45. The Ismailians.—The history of the Ismailians is of great interest not only in itself but also in that the tenets of the sect are still a living force in the Mohammadanism of this part of India. History does not tell us what became of the children of Ismail, but their sacred character lent itself to the foundation of one of the most remarkable and important organizations known to history. The Ismailians were first organised by Abdulla, a native of the Persian Province of Khuzistan, who retained or revived the organization of the sect into orders which had been introduced in the time of the fourth Imam. His successors however gave an entirely new character to the sect. The descendant—probably a spiritual, not a natural descendant—of Abdullah the Ismailian proclaimed him-

self the legitimate descendant of Ali and Fatima, and assuming the title of Al-Mahdi, usually given to the last Imam, founded the Fatimite dynasty in Egypt. His descendant Mohammad-ibn-Ismail indeed went a step further and accepted the doctrine that the Khalif was an incarnation of the invisible Imam and as such a god on earth, abandoning apparently the pretence of actual descent from Ali. To this teaching the sect of the Druses owes, in some obscure way, its origin, and the idea that the Mahdi need not necessarily be re-incarnated in a descendant of Ali was fruitful in its results, for to it may be traced the claims of various Imams to that title. In India Sheikh Alai of Agra claimed to be Al-Mahdi and as among his disciples was Sheikh Mubarik, the father of Abdul Faiz, the Wazir of Abdar, it is probable that that emperor was greatly influenced by Mahdavi ideas. To the same teaching may be ascribed the origin of the Babi sect in modern Persia, whose doctrines appear not to have penetrated to India, and various other movements in the Mohammadan world.

When the fortunes of the Western or Egyptian Ismailians were on the wane, the sect was revived, in Syria, by Hasan Ibn Sabah, who was like Omr Khayyam a companion and protégé of Nizam-ul-Mulk, Wazir of Alp Arslan, Seljuk. Hasan reorganized the order, which he divided into seven grades, one of which was called the Fidwi, or 'consecrated,' and which became popularly known as the Hashishi, or hemp-eaters, a term soon corrupted into Assassin in the European languages. Of this order Hasan was the first Sheikh, or chief, a title somewhat unfortunately translated Grand Master, seeing that the Sheikh claimed to be—at least in the person of Mohammad Kiah, the third Sheikh—an incarnation of the concealed Imam, wielding supernatural powers, and 1:2 merely the head of a militant religious order.

From their stronghold at Alamat in the Elburz* the Sheikhs dominated Mohammadan Asia, by a perfectly organized system of assassination, during a century and a half, until, towards the close of the thirteenth century, the last Sheikh was overthrown by Hulaku Khan, the descendant of Zenghiz Khan. The sect however was not exterminated, and, though it had lost its power, continued to exist, but rather as a sub-sect of the Ismailians than as an independent organization, in Irak and the anti-Libanus. Its present head, a lineal descendant of the fifth Sheikh, is His Highness the Agha Khan of Bombay, who has a considerable following in the Punjab and the regions of the Hindu Kush.

46. The Sufi orders.—The Sufis have, in addition to their various sects, thirty-two orders, whose origins and relations to the various sects are exceedingly obscure, but in certain cases they resemble the sects in that their founders were descendants of Ali and as such shared in the inherited sanctity of the Imams.

Of these orders the oldest is the Qádria, founded about 1100 A.D. by Abdul-Qádri Jilani, a descendant of Ali through the martyr Hasan, according to the genealogies preserved in India, though the Shias are said to deny his claim to this descent.

The Qádria sect has had several branches in India, as for example the Muqimia, Pakrahmania and Naushahi.† Closely connected with the Qádria is the Saharwardi order, founded circa 1200 A.D. in Baghdad, and established in the Punjab by Baha-ud-din Zakaria or Bahawal-Haqq, Multani, a fellow traveller of Sayad Jalal, two centuries later. From this sect again branched off the Jalalis.

Another of the thirty-two Sufi sects was the Naqsh-bandi or mystics, founded about 1300 A.D. in Persia, by Pir Mohammad. One of the earliest leaders of this sect was Haji Bektash, who was succeeded by Khoja Ahmad; the Bektash, also called Qizzil-bash or Kizzilbash, appear, however, as a separate sect or order in the list given by Cooke Taylor in his History of Mohammadanism.

Lastly the Chishtia sect, founded in Khorasan, and introduced into the Punjab by Khwaja Farid-ud-din Shakar-Ganj, (usually known as Baba Farid

Elburz, the Sanskrit Haralthi, would seem to have been famous for its hemp (Soma) in Vedic times. (Oldenberg, Religion of the Veda, page 178).
 See paragraph 29 supra.

Shakarganj), in the thirteenth century, and revived in the Punjab by Khwaja Nur Mohammad, the Qiblai Alim of Maharav, in the Bahawalpur State, towards the close of the eighteenth century, is the most important Sufi order in the Punjab, in which province it has fifteen gaddis.

And yet again from this sect branched off the Nizamias or disciples of Khwaja Nizam-ud-din Aulia Dehlavi, or Mohammad bin Ahmad Danial, a disciple of Khwaja Farid-ud-din Shakar-Ganj. This sect does not appear in our returns.

47. The Roshanias .- From the earliest times of Islam there have existed sects professing doctrines not inculcated in the Koran, or even condemned by it. These doctrines appear to have been from time to time revived in Persia, and in Khorassan, which from the very first age of Islam had been the fruitful parent of heresies: there appeared the Ravendis, who taught the doctrines of the transmigration of souls and the successive incarnations of the Deity. With these were associated social doctrines advocating community of women and the equal distribution of property. In the middle of the 16th century there was in the Punjab a revival of these doctrines, headed by Bazid, an Ansari Sheikh, who was born at Jullundur, where descendants of his family still live. Bazid adopted the title of Pir Roshan or the Apostle of Light, apparently in allusion to the 'light of Mohammad, but he was called by his 'orthodox' opponents Pir Tarik or the Apostle of Darkness. He laid aside the Koran, taught that nothing existed save God, and that no set form of worship, but only implicit obedience to his Prophet, was required. He also preached communism of property, and his followers practised community of women. The sect was for a time powerful. It embraced half the Pathan nation, yet Bazid was imprisoned by the Government of Kabul and only released on payment of a heavy ransom. After this Hashtnagar became his seat, but on his death the sect languished. Its most active supporters were the Afridis of Tirah, the Yusafzais having been re-converted to orthodoxy, and in 1587 Akbar in person defeated Jalal-ud-din, the son of Bazid, in an expedition against the Roshanias of Tirah and the neighbouring hills. Nevertheless Jalal-ud-din, a son of Roshan, obtained possession, for a time, of Ghazni in 1600. In 1611, however, the Roshanias, having caused a revolt at Kabul, were put down with great slaughter and the sect died out, its tenets continuing to be professed only by Bazid's descendants in Tirah and Kohat, and by some of the Bangash and Orakzait Pathans.

The family of Bazid itself, however, was not exterminated in 1611, for the sons of Jalal-ud-din received Mau Shamsabad near Agra in jagir, through the influence of the Wazir of Shah Jahan, Sa'ad-ullah Khan, who was himself, according to tradition, a disciple of Bazid. But how far the doctrines of the sect survived is by no means clear: although that they have greatly influenced Mohammadan beliefs in these Provinces appears certain, for a number of songs which commemorate the miracles of Sheikh Darwesh and other members of Pir Roshan's family are still sung by fagirs in the Punjab, and in these songs allusions Legends of the Punjab, Volume III, pages 158- are made to the Sayads of Bokhara on the 217 (page 163 and page 175). one hand, and on the other to the spiritual influence of the family on Sher Shah Sayad Jalal (of whom I shall speak later). It would indeed appear probable that the Roshania heresy was a Shia development. The name of the sect, its persecution by orthodox Islam, and its doctrines, all point to this conclusion, but the doctrine of metempsychosis, which, according to Bellew, Bazid professed, is exceedingly common and may not be confined to the Shias. It should however be noted that Raverty states that Bazid was a Suff, but, having been a disciple of Mulla Suliman, Jalandhari, he became initiated into the tenets of the Jogis and so converted to the doctrine of the metempsychosis, to which he added the dogma that the most complete manifestations of the divinity were made in the persons of holy men. Both these doctrines were however far older than the Roshanias.

48. The recent history of Shiaism.—The above notes will have shown that from the earliest times the Shias were found chiefly among the non-Arabian

Possibly the custom of vesh found amongst certain Afghan tribes is alluded to. It would be worth while enquiring whether the custom of each is in any way connected with Shiaism.
†Probably spiritual descendants of the Roshanias.

races of the Mohammadan world, and that by the irony of fate the descendants of the Prophet found their most zealous supporters amongst the alien peoples. As we come down to modern times we find that Shiaism becomes more and more a question of race, or, in India of caste, its tenets finding a more configential soil, as far as one can see, among the races of Iranian and Indian origin than among those of Arabian descent, or those which have come under Arabian influences, and it will thus be of interest to give some details as to the races and castes which profess Shiaism.

49. The races of the Shias.—It has been observed above that Pir Roshan found followers among the Pathans, yet no Afghan or Pathan* is a Shia at the present day. The Shias of Afghanistan are the non-Afghan races such as Hazaras, Kizzilbash, Tajiks, Farsiwans, Badakhshanis, Roshanis, etc., and in Kurram the Turis, who have further compelled the Bangash to adopt that creed.

The above tribes are ethnologically of great interest, but we know little of them.

The Turis are the dominant tribe in the Kurram Valley (in which curiously enough is a village called Jalandhar). Probably of Punjabi origin they are said to be allied to the Khattars of Fatehjang and are closely related to the Jajis. Their occupation of Kurram dates from at least four centuries back, for they are mentioned by Babar in his Memoirs, and they are now thoroughly Afghanized, except in religion. They are divided into two factions, Drewandis or the followers of their old Sayads, who appear to be Bokharis, and Mian Murids or adherents of the Tirah Sayads, whose influence was imported into the Valley in 1820 A. D.

Each family has its hereditary mourners, who possess great influence and take the place of the mullahs in the Pathan tribes—there being no mullahs among the Turis, who as Shias pay great reverence to Sayads—and the matim kotha, or mourning house of the village, at which every Friday and for 13 days in the Moharram all the villagers assemble, is the centre of their religious life. They must make, if means permit, a pilgrimage to Karbala and Mashhad, and are closely connected with Persia, Shalozon village being closely connected with the provinces of Mazenderan and Azarbeijan. On the other hand few go to Mecca. Their celebration of the mourning in the Moharram is of intense earnestness, and the Christian martyr (shahid) who was killed at Karbala by the side of the sons of Ali is still commemorated in the sermons of the Sayads at this time.†

The Kissilbash.—Kizzilbash, or red-head, is an offensive nick-name given by the Turks to the Bektash of Cappadocia, Shias in faith, or with a religion which is a strange mixture of Shiaism, Paganism, Manichzeism, and Christoff of Shiasm, Paganism, Manichzeism, And Christoff of Shiasm, Paganism, Manichzeism, and Christoff of Shiasm, Manichzeism, Manichzeism, And Christoff of Shiasm, Paganism, Paganism, Manichzeism, And Christoff of Shiasm, Paganism, Manichzeism, And Christoff of Shiasm, Paganism, Paganism, Manichzeism, And Christoff of Shiasm, Paganism, Manichzeism, Paganism, Paganism, Manichzeism, Paganism, Paganism

The Shias of the Hindu Kush.—The Shia doctrines are widely spread in the Hindu Kush, being found in Skardo and Nagar, where their followers outnumber the Sunnis, and also in Gilgit. The territories of Yasin, Hunza, Shignan, Roshan, Wakhan and Sarikal are inhabited by a sect called Mullai or Moghli,‡ the adherents of H. H. the Agha Khan of Bombay, who also has many followers among the Hindu Jhiwars and Sunars of the North-West Punjab. How far this sect is an off-shoot of the Shias I cannot say, but they appear now to be dissenters from, and opposed to, that sect.

^{*} Mr. Merk is of opinion that the Shias of Tirah are the spiritual descendants of the Roshanias.

This account of the Turisis based on the latest information available, but it should be noted here also that Rawrity regarded the Turis as Robentains, not as Shina. The Turis have or had a cerious custom. When they meet a stranger they ask first if he is 'straight' or 'crooked' putting the forefinger to the forehead first straight, the ment. Shin 's 'straight' they mean' Shin'.

[†] Possibly these names are preserved in the place-names of Mullahi Tola (in Attock) and Uch Moghali in Bahawalpur.

The Oraksai Shias .-- Among the Orakzai Pathans the Shia is distinguished by his reverence for the Sayads who take the place of the mullahs among the by his reverence for the Sayats who take the place of the minians among the Sunnis. The Sayad's person is sacred, his curse is feared, and all the property of his disciples (murids) is at his disposal. The Shias often visit Karbala, add Ali's name to the kalima, and pray with open, not folded, arms, resting the forchead on a sijda-gah, (a round stamped piece of baked clay about 13" in diameter), which every Shia carries, together with a rosary of many coloured beads, of Karbala clay, and a comb, all of Karbala manufacture. Like the Turis they have matim khanas in lieu of mosques, and the only influential mullahs amongst them are those who can recite the elegies (marsias) on the deaths of Hasan and Hosein. elsewhere the Shias are more careful about ceremonial than Sunnis, for they refuse food cooked by a Hindu, though they may take uncooked articles from his hands. Nor will they eat anything halat'd by a Sunni, or hares, or the kidneys of sheep and goats. A Shia can be recognized by the fashion of his turban and the dark khaki colour of his clothes, as well as by the absence of whiskers, and the separation of the beard from the moustaches, the upper lip being shaved for a finger's breadth. The Shia may smoke tobacco in a bowl (chilam), which is forbidden to the Sunni by the mullahs. The Nauroz is especially a Shia festival. Shias take Sunni wives, who become converts after marriage, but do not often give a daughter to a Sunni.

The origin of the Oraksai.—The Oraksai is a tribe of obscure origin and it is doubtful if they are true Afghans, though they are said to belong to the Karlanrai race, being descended from Kadi, the younger son of Karran, as are the Dilazak. The tribe itself claims descent from a Persian prince, Sikandar Shah, who was exiled (**pruksai*, lost or exiled) from his father's kingdom, and took refuge with the Mohammadan king of Kohat, by whom he was employed to subdue the Tirahis of Tirah; who were then Hindus or non-Afghans, ruled by various rajas and divided into two branches Dilazak and Parbali. Sikandar Shah conquered the Tirahis, and on the death of the Kohat king claimed that region as his son-in-law, but was opposed by Banga, a Dum or musician of the Persian court, who had been despatched in search of the prince, but had passed himself off at Kohat as his brother, and obtained the second daughter of the king in marriage. Failing to conquer Banga Sikandar Shah returned to Tirah, and married a Tirahi woman as his second wife. After his death his descendants waged constant wars with the Bangash, or descendants of Banga, until the plain country was allotted the latter and the hills to the Orakzai.

Bellew assigns a common origin to the Orakzai, Afridi, Bangash, etc., and says the Bangash were ousted from Zurmat in Waziristan by the Ghiljis and driven into Kurram, and thence into Miranzai and Kohat, whence they expelled the Ghabris, Safis and Mangaris, three non-Afghan tribes, of whom the first may be the modern Ghebas of Tahsil Pindi Gheb in Rawalpindi. The Orakzai include however several tribes such as the Sheikhan, of Gardez in Waziristan, the Mishtis and Ali Khels, both originally Yusafzai, and the Malla Khels, of Ghilzai desent, who are not true Orakzai. These tribes however are not Shias, for that sect is practically confined to the Mohammad Khels, who include the tribes shown in the margin, though the Tazi, Bar Aud.

Bar Mohammad Khels, Mani Khels,

Sipayas.

and Lar Aud, three hamsaya or vassal sections of the Tirah Sturi, or Afzal Khels, in Tirah, are also Shias. The Mohammad ording to the tribal pedigree, and it is interestter shrips of the South-West Punish for the

Khels are descendants of Bazid according to the tribal pedigree, and it is interesting to trace their connection with the shrines of the South-West Punjab, for the Spayas have two shrines, one at Usi, a xiarat of Pir Kamal Shah, a grandson of Makhdum Jahanian of Uch in Jhang, and the other a shrine of Pir Saidan Shah, a cousin of Makhdum Isa of Bilot in Dera Ismail Khan.

The Chamkannis.—The Chamkannis, Para Chamkannis or Chakmannis were a heretical sect of Persian Mohammadans, who fled from Persia to escape persecution, and who were called Ali Ilahi, a sect of Shias (not mentioned in Cooke

^{*}Ushi, in Persia, was the birth-place of Khwaja Qutb-ud-din, who came to Ajmer and studied under Mu'in-ud-din Hasan Chishti, and thence migrated to Delhi. Amongst his disciples at Delhi were Khwaja Farid-ud-din Shakarganj and the emperor, Shams-ud-din Altamsh. (Punjab Notes and Queries, 18{4, \$1054, quoting from the Tarikh Makhzan).

Taylor's list of the thirty-two Shia orders). They had peculiar ceremonies and curious stories are told of the immoral proceedings connected therewith. A burning light was, it appears, an essential element in their rites, in which both sexes joined, and on account of this light they were called by the Persians Chiragh. Kash,* or 'lamp extinguishers.' The Chamkanni appear now to be almost entirely Sunnis, though the Budh Khel section is still Shia. The tribe has four main sections:—

whose names suggest a quasi-sectarian organization. According to Afghan accounts the tribe was dispersed 500 years ago owing to a great famine, one branch going to Kabul, one to Peshawar (where they still hold Chamkanni village), and some to Hindustan, but the bulk of the tribe remained near the southern slopes of the Sufed Koh, west of Tirah, and held their own against the Orakzais and Turis.

50. The castes of the Shias.—The distribution of the Shia population is one of considerable interest. According to our returns they are found chiefly in Mianwali, Jhang, Shahpur, Rawalpindi and other Districts on the Indus, and in Kurram, but they are represented in nearly every district. Mr. Maclagan observes that the Shias of Gujranwala are mostly Bhattis, and those of Jhang Sials, under the influence of the Qoreshis of Hassan Balel and Shorkot, and of the Sayads of Uch: while in Jhelum the Shias are mainly Sayads, Mirasis and Kanjars. The Ghakkhars, who claim a Persian origin, used to be, according to Sir Lepel Griffin, many of then Shias, but it appears that they are now exclu-

sively Sunni.

The Khojas,—Haji Sayad Sadr-ud-din's tomb is at Trindah Gorgej in the pesikari of Gothchani of Bahawalpur. He was a contemporary of Sher Shah Sayad Jalal and is also called chaurasi-rosawala or "having 84 shrines," because 84 perfect saints had shrines in his time. This strongly reminds us of the 84 Siddhs of Gorakhnath. He converted many Hindus, to whom he is known as Machhar Nath', to Islam, and appears to be the author of the Dasavatar, which describes the ten incarnations, nine of Vishnu and the tenth of Ali, the son-in-law of Mohammad. His converts included many Khojas in Sind and they built the shrines of this saint and of his third son Sayad Ghias-ud-din at Uch. Sayad Hassan Kabir-ud-din or Hassan Darya was the eldest son of Sayad Sadr-ud-din. He was so called because he once met a party of Hindus on their way from Sindh to the Ganges, and promised them they should see that river and the Jumna close by at the Panjnad or Indus. Upon his fulfilling his promise they became converted.

According to Burton, the Khojas of Sindh are Persian immigrants who do not worship in a mosque, but in a khano, or lodge, and are Ismailias, but they are not connected with the Punjab Khojas. The latter are undoubtedly, for the most part, converted Brahmans, Khatris, Aroras, etc., and, though not returned as Shias, often belong to the Qadriat or Chishtia sects, as is the case at Leia where they are numerous. Those of Dera Ismail Khan have a Pir at Maghiana, in Jhang, and another at Baghdad, but details are wanting. Again the Punjab Khojas are also independent of the Bombay Khojas and do not own any allegiance to His Highness the Agha Khan and they were prohably converted to the Qadria and allied sects in the time of Akbar, whose association with the legends of the Jats and Khatris is curious. In the case of the latter, legend may well have preserved something historically

Or lamp-bearers (?). There is still a Mohammadan sect so named, as to which I have no particulars.

[†] Machhar. ==mosquito, and is a common nick-name. It is curious that so many saints have names of plants or animals.

[†] The Khojes of Jammu, who are converted Khatris (and apparently Brahmans and Arcras), call themselves Sunnis, but are either of the Qadria or Nagabbandi sects.

true, for Akbar's attitude towards the Hindus was one of extreme tolerance. To this day the Bhat at a Khatri wedding (in Bahawalpur) gives two cocoanuts to the bridegroom's father, one in the name of Akbar, the other in the name of Todar Mal, Tannan, his minister. The story is attributed to the emperor's practice of sending a cocoanut as a wedding-present to every Khatri, and may very possibly commemorate a policy of conciliation towards the Hindus in the Punjab which led to the acceptance of the Shia form of Islam by some of the castes above mentioned. Further traces of the Shia influence in Hinduism may be seen in the fact that the Brahmans of Goliana, a village in Tahsil Gujar Khan of Rawalpindi, are murids or disciples of Abdul-Qadir Jilani, while the Khatris of the Handa section reverence Sheikh Farid Shakar Ganj as their patron saint, and take their sons for the maunan, or first hair-cutting ceremony, either to Pakpattan, or to a tank near Gujrat into which a brick from the saint's shrine at Pakpattan has been thrown. The Mokol Khatris also employ a Qazi or Mullah at the janeo ceremony.

The Parachas.-The term Paracha is applied, on the frontier, to any Mohammadan trader, most of the traders being converted Hindus. In the Puniab the term is also used loosely for any Hindu convert to Islam, but at Makhad, on the Indus, there is small distinct community claiming descent from two daughters of Naushirwan (i.e., a Persian origin), which goes by that name. Originally fire-worshippers, they were converted by Mohammad Mustafa, and became carpet-weavers, (firash), whence the name. They profess to be Sunnis, and are nearly all of the Qadria or Chishtia sects, few being Nagshbandis and none Saharwardias. There is a branch of the tribe called Sawal at Mullahi Tola in Attock, and they have a considerable colony at Bukhara.

The Bára Sa'adat.—The Bára Sa'adat of the Jumna-Ganges Doab, with whom many of the Eastern Sayads (of

Delhi) are connected, enjoyed considerable political importance during the latter days of the Moghul empire. The Bara Sa'adat are avowed Shias*, and claim descent from Savad Abdul Proof Wasit, who in 391 A.H. came to India with Sultan Mahmud Ghaznawi, and the Sayad's three elder sons settled near Sirhind, being afterwards joined by the fourth son, whence as the Mohammadan conquests extended their descendants' influence spread over Delhi, Mirath and the whole of the Doab. The term Bara is explained to mean 'outsider', because some of the Sayads lived in the country, as opposed to 'Shaharwala' applied to those who lived in the city of Delhi itself. Bara however could hardly be derived from bahir-wala, and it seems clear that it means 'twelve'.

The Bára Sa'adat have a very curious organization. The people of each village have a special nick-name or designation, such as kutta, dog, (Kakroli village), ulu, owl (Sakrera), he ass and she ass (Ghalibpur and Sedipur). These at first sight look like survivals of ancient Arabian totem-clans, but there are other (and more numerous) names denoting trades, etc., such as, sweeper, bangle-maker, dum, green-grocer (Kunjra), barber, oilman, etc., and some even less flattering, such as chitora, funny, chutiya, fool, dar-ul-hamagat, 'house of folly,' kungar, rustic, ghost and she-ghost (bhul-ni). These terms may possibly be relics of a system of initiation into the degrees of a secret order, and they are paralleled in Turkey in the order of the Maulavis, in which the novice is called the scullion, and so on. It is also conceivable that the term barah points to a former division into twelve degrees. The Sayads themselves explain that the nick-names are pass-words (palwal), which clearly indicates that some such organization as those found among the Ismailians, once existed.

51. The black and white factions.—At the risk of being tedious I insert here a few notes on these factions because they appear to be in some way connected with Shiaism.

In the fifteenth century Khoja Mahtum Azyam, a Sayad and a descendant of the Prophet, of Bokhara, acquired considerable influence in Kashgar. This

[.] Except one village (Latheri) and even they marry with the Shias of the Bera Sa'adat,

influence devolved upon his sons, the Imam Kalyan and the Khoja Isak Wali,

*Ido not know the meaning of this term.
and Duvans.* The brothers' teaching differed little in essentials, but they founded two separate and bitterly hostile sects, the Ishkiya or Ak-Taulins (White-Mountaineers), and the Isakiyas or Kara-Taulins (Black-Mountaineers), factions which still exist. The quasi-civil or religious war between these sects or factions lasted for generations until the Chinese conquered Kashgaria, when it ceased, and the Khojas united to throw off the Chinese yoke which they succeeded in doing in 1864, but were supplanted by their commander-in-chief in the sovereignty.

Black and white factions also exist in Afghanistan, under the names of the Spin or white faction and the Tor or black faction, which prevail to the west of the well-known Samil-Garai strife. Of the tribes mentioned above the Turis are par excellence Spin Gund, and with them are the Chamkannis and certain other tribes. The Orakzais are, pro forma, Tor Gund, but other tribes are zealously attached to that faction. There are further traces of these factions among the Khattars of Rawalpindi who are divided into two branches, Kala and Chitta (black and white), and have a curious tradition that their founders Hashmi, Abdulla and Mustapha, were Arabs who came to Baghdad, in the time of Harun-ul-rashid, and thence to Bilochistan, where there are 9,000 'Khattar Sulana' or Khattar houses or graves. With Sultan Mahmud Ghaznavi they raided into the Punjab and eventually settled at Bagh Nilab on the Indus, where they became Hindus (a tradition not perhaps as absurd as it looks), and thus their former employment of Brahmans at weddings is explained. That they were originally Shias may be conjectured from their former prejudice against eating hares.

Whether these wide-spread Black and White factions had a common origin cannot be decided with certainty, but it is at least a plausible conjecture that they are survivals of former religious differences between Shia sects, and that the Gar-Samil strife may have had a similar origin.

51. The extent of the Sufi influence.—Although the Census data appear to indicate that the Sufi influence is increasing they still fail to show how deep and wide-spread it must have been. If it be conceiled that the Qadrias, Naushahis, Chishtias and their derived sects are to be regarded as Sufi off-shoots it will be found that the Sufi figures are very much below the mark. This may

be proved from a consideration of the caste returns, many districts, which show few or none in sect-returns, considerable numbers as Qadria, Naushahi or Chishti by caste, and as this is a point of some importance I give the figures in detail in the margin. It is moreover probable that the numbers of these castes, which have been returned as sects of fagirs, are considerably understated, as for instance Patiala only returns 1,071 Chish-tis (by caste), but at Gharam in this State is the shrine of Mohammad Sayad Miran Bhik, a disciple of Shah Ab-ulMuali, of the Chishtia order. This is said to be one of the principle shrines of the order, and the numbers returned as Chishtis by caste probably do not represent the total number of its followers.

Again Patiala only returns 432 Qadrias by caste, yet as it contains the strine of Jogi Shah, Qadria, at Masijan, the number of Qadrias must be a good deal larger. It is almost certain that in the frontier districts at least the numbers of these sects have been greatly understated, and this tendency to concealment has doubtless affected the returns in most districts cis-Indus. It is noticeable that only 22 Naqshbandis by caste are returned in both Provinces.

The Chishti and Qadria castes.—The present figures are very remarkable, the total numbers now returned as Chishti by caste alone being 12,945 or nearly

thrice as many as the numbers returned as Chishtis by sect or caste in 1881. Of these 7,096 are males and 5,849 are females, so that the order or sect would appear to have now developed into a caste, a theory borne out by the remarks in paragraph

518 of the Census Report of 1883. The Chishti caste is very widely spread, being found in every important District and State, except in Peshawar, Kohat

in Peshawar, Kohat and Hazara. It has increased, according to our returns, principally in the South-East of the Punjab, as the marginal figures show. It may be noted that in Gurgaon the shrine of Sheikh Ahmad Chishti is mainly frequented by Hindus.

In the south west of the Punjab it seems clear that the Qadrias, Naushahis, etc., are being absorbed into the Chishti caste, but in other parts the Qadrias would seem to be forming a separate caste and they are certainly increasing in numbers, as in 1891 only 2,921 Qadrias by caste were returned, or less than half the present figures.

53. Mohammadanism in the South-West Punjab.—It will probably give a better idea of the Mohammadanism of the South-West if some of the characteristic local shrines are described, than if any generalizations be attempted.

In the Kardari of Bahawalpur, at Musafarkhana, are the seven tombs of Ali Ashab, of which five are nine yards in length, while the sixth is three yards long, and the seventh is invisible. These are the tombs of six of the companions of the prophet, Ali, Gul Sahib, Ahmad, Pir Zakria, Mubarik ard Langra Sahib, and they are visuted by the sick, by those who want offspring, by thieves who desire success, and so on. Seven fairs are held, on all the Fridays in Jeth and on three Fridays in Har. Cattle are also brought to the shrine to be cured of disease. Hindus also make vows to the shrine but they have a special ritual, for when a Hindu makes his offering he and his wife must fast, but he may cook a kid's liver, with which, when, blessed by the mujawar of the shrine, his wife may break her fast. At such times no Hindu can be polluted by touch.

Near Mau Mubarik lies Khaki Suhaba, (also named after a companion of the prophet), a shrine at which vows are made for offspring of man or beast. If the prayer is granted, a thick cord is presented to the shrine, the trees round which are full of hanging ropes thus presented.

But the centre of Mohammadan influence in the South-West lies at Uch Sharif, in Bahawalpur, the ancient Deogarh or 'fort of the god.' There are two Sayad families at Uch, the Bukhari and the Jilani, the former of which has an interesting religious history.

54 The Bukhari Sayads of Uch.—This family traces its descent to Pir or Makhdum Sher Shah Sayad Jalal-ud-din, Surkhposh, Bukhari, also entitled Adam the second, because of the numerous families which claim descent from him and generally known as Sayad Jalal for Sher Shah Sayad Jalal. He was born at Bukhara on Monday the 1st of Ramzan, A. H. 595, and completed his education at the age of seven. In the course of his wanderings he met King Hulaku whom he attempted to convert and who ordered him to be burnt alive, but the fire turned to flowers and Hulaku became a Mohammadan giving his daughter in marriage to Sayad Jalal. Sayad Jalal's son, Sayad Ahmad Kabir, was the father of Makhdum Jahanian who succeeded Sayad Jalal at Uch, to the exclusion of his father and uncles.

The Bukharis thereafter founded the shrines of Hazrat Mohammad Rajan at Buland Roza, (the high shrine), at Uch Bilot in Dera Ismail Khan of Pir Kul Inam at Uch Imam in Jhang, of Sayad Isa Abdul Walab at Uch Sayad Isa in Dera Ismail, and of Sakhi Din Panah at Dera in Muzaffargarh. The place-name Uch appears to be peculiar to the Bukhari and Jilani Sayads, and to have be imported by them from Bukhara.

The Khalifas of the Bukhari Sayads deserve mention. Pir Khusru was the Deputy of Sayad Ali Abul Mawid and was the forerunner of his son Sayad Jalal at Uch The Pir stood on a charmed stone (of small size, but which no man could lift), and uttered the asan or call to prayer, in defiance of the attacks of the Hindus, who had hitherto not permitted the call to be practised

Another Khalifa of Makhdum Jahanian was Abdulia Jahanian, whose descendants, the Kukaras or Nekokaras, hold the shrine of Jubba Sharif at Sheikh Wahan, so called because a robe (jubba) of the prophet is kept there, with a sceptie of the khalifa and a sword of Sayad Jalal

Raijan Qattal.—The real tomb of Sheikh Sayad Sadr-ud-din Mohammad, also called Shah Wilayat, or Raijan Kattal, the perfect saint, is near Karbela in Asiatic Turkey, but there is also a memorial tomb at Uch. His glance could consume birds as with fire, and he once rode to the site of the present shrine of Makhdum Jahanian on a wall, using a snake as a whip: in proof of which the marks of the whip are still visible on the wall.

55. Channar Pir.—Four miles from Derawar, on a hillock, is the tomb of Pir Channar, or Chanan Pir, son of Rai Sandhela. Sayad Ja'al visited the city of the Rai, pow in ruins some three miles off, and asked if there was any Mohammadan in the city, male or female. He was told that there was none and he then asked if any woman was pregnant. The Rai said his wile was, and the Sayad then ordered him to employ a Mohammadan midwife for the child would be a saint. When the child was born the Rai exposed him on the hillock but a cradle of santal wood descended from heaven for the child. Seeing this Rai Sandhela endeavoured to take the child out of the cradle, but failed, as whenever he approached the cradle rose in the air. When the child grew up, he accepted Makndum Jahanian as his Pir, and as he was brought up in poverty so his tomb is especially efficacious for the rearing of children. The Channar tribe is descended from the seven brothers of the Pir. Both Hindus and Mohammadane frequent the shrine, rot or thick bread and meat being eaten by both as brethren. Hindus are not polluted by contact with Mohammadans at the shrine. The

^{*} K stal, perfect, o Qastal, the slayer of the infidels. His history is given in the Wilaystnama" of Makhdum Hamid Ganj Baksh Kunj-gir. This Sadr-ad-din must not be confused with the Sadr-ad-din who converted the Khojas.

Channars sacrifice a she goat here, others ata ghata. There is also a shrine called Channa Panna near Khanpur. Possibly both these shrines were originally the tombs of the ancestors of the Chantar tribe, and the present cult of Chantar Pir has every appearance of being a survival of ancestor worship.

56. The Jilanis — Sayad Bandagi Mohammad Gaus Sahib was deputed by Hazra. Sheikh Abdul Qadir Jlani on a proselytizing tour and directed to halt whenever his camel stopped, and to settle there if a flag fixed in the ground could not be moved. The sign was vouchsafed at Uch Jilani, and there his tooth-brush, which he had thrown away, grew into an arak tree, which is still fourishing and whose leaves will cure every disease. His mausoleum however appears to be at 1 ahore and he left another tooth-brush at Ludhiana, where the Roshani fair is still held in his or its honour. His descendants are given in the following table. One of his wives was Ves Kasain, daughter of Sultan Qutb-uddin Langah, King of Multan.

ayad Handagi Mohammad Gaus Jilani.

S. Abdul Qadir II† S. Abdula Rabbani, S. Mubarak Haqqani, S. Mohammad Nurani

S. Sheikh Abiu Qairi III. Jamal-ud-din, Abul-Hovain, Nawab, Musa Pak Shahid, Makhdem ul-odk, (Buried at Multan.)

A disciple of Abdul Qadir II, Ghias-ud din, a son of Jahan Khan Langah, used to see the Prophet every; night in a dream and once received from him the handle of a flute (dasta-inai) which had the power of curing pneumonia, and other diseases. This article is still shown at Uch Jilani, together with a mark of the Prophet's foot, parts of the Quran written by Hassan and Husain, the robe of Abdul Qadir Jlani, and other relies. The Jilani influence appears however to have been extended rather towards the north and centre of the Punjab than in the south-west. In the latter direction it has become fused with earlier behefs, as in the following instance.

Setha Bhutta—Seven brothers named Pir Pathra, Mohammad, Yasin, Ghani Mohammad, Jetha, Bhutta and Ghulam Mohi-ud-din, and descentled from Shekh Shajra of the Lar tribe were contemporaries of Abdul Qadir Jilani, the seventh being so called as a servant of Mohi ud-din of Baghdad. The tombs of the three latter prothers lie near Kinanpur, in Bahawalpur, where they were killed in defending a woman from robbers, and they are called collectively Jetha Bhutta Sahib. At these shrines Mohammadans and Hindus perform the first hair-cutting of children and even Sikhs venerate the shrines. There is also a charm for curing cattle of muhara or foot and mouth disease, which runs:—'Jetha Bhutta Sultan, Barkat Khwaja Suleman, Di muhara howe pasheman,' or 'with the blessings of Jetha Bhutta, and of Khwaja Suleman, may the muhara disappear.' Sheikh or Pir Pathra, from whom alone are descended the guardians of the shrine, has a separate tomb. The cult, which was originally a mixture of ancestor worship and of reverence paid to those who have died a heroic death, appears to have been taken over as it stood by the Mohammadan followers of Abdul-Qadir Jilani.

One other shrine in Bahawalpur owes in part its origin to this family.

Sevrai.—Sarwahi or Sevrai was the city of Sevraj, a raja, conquered by Haji Mohammad Araqi. Sheikh Taj-ud-din Shahid, Sultan Mahmud Burkati and Sheik Azir Khatib, of whom all but the last were killed in the assault Faqirs sit in meditation at the tomb of the first, and it is efficacious in the cure of disease. Anyone who can go round it seven times without taking breath will obtain anything he desires. This saint will not permit any building to be built over his tomb. The tomb of Sultan Mahmud has vanished, but at the other

[•] Ata-ghata 'flour and sheep.' The Sayada, at least those if Uch, appear to preserve the Arabian currom whereby the son is named after his grand-stater. The Bitoch hee the name custom with this modification, that the son only takes the grand-father's name it been after the latter's death. The custom also exists among other tribes of the South-West. It is a traifful source of confusion in Ingend and in history.

^{1&}quot; Music and dancing were strictly prohibited by the traditions of the prophet; but several orders of the Devisibes, and more e-pecially the Maulvies (a resignous order) institude that the exercise of these, in a mystic sense, was an acceptable form of devotion." Cooke Taylor's History of Mohammadanim, page 232. The Maulavis use the mri or flute.

two vows are made for offspring. Haji Mohammad Araqi was a cousin of Sheikh Abdul Qadir Jilani.

57. The Chishtis.—Sheikh Taj-ud-din Chishti was the grandson of Harrat Farid-ud-din Shakar-ganj and his descendants founded the village of Chishtian in Bahawalpur. His shrine is also called Roza Taj Sarwar. Many tribes accepted Islam at his hands, especially the Sodha and Rath of Bikaner, and this led to war with the Riputs of that State. The saint on going forth to battle pitched a flag on top of his house and told his women-folk that as long as the flag stood they would know he was safe. Unfortunately the flag was accidentally knocked down and the women prayed for the earth to swallow them up, as the saint had commanded Their prayer was granted and they were engulfed, only the edges of their shawls remaining outside. A tower was built on the spot at which women make vows. One of the women, however, a Bhatti by caste, did not join in the prayer and was not engulfed, but made her escape. Hence the Chishtis do not marry Bhatti women to this day.

Near this shrine, at the tomb of Khwaja Nur Mohammad, stood five large jand trees, called Panjan Piran de jand, or the jand trees of the five pirs. Under their shade Bawa Nank once sat and prophesied that he who should obtain possession of it would indeed be blessed, for it was a part of paradise. Mohammadans here sacrifice goats and sheep after offering prayers for rain. Hindus offer a covering of chintz for the restoration of health, and sugar and boiled grain for rain.

The four chief Khalifas of Qiblai-Alim were, Nur Mohammad II, of Hajipur or Narowala, in Tahsil Rajanpur, Qazi Mohammad Aqul, of Chachran Sharif, Hafiz Moha mad Jamal Multani and Khwaja Mohammad Suleman Khan, of Iaunsa Sharif, in Tahsil Sanghar. The Chishti influence is wide-spread, extending over the South-West of the Punjab, Bilochistan and Sindh. The village of Chishtian remains the centre of the sect, and there is an Arabic school there financed by the Educational Department of the Bahawalpur State.

Khalifa Mohammad Aqil was a Qoreshi and one of his descendants, Sheikh Mohammad Kaura, founded the religious tribe called Kaura, Mohammad Aqil's shrine was at Kot Mithan, but, when Maharaja Ranjit Singh conquered the Derajat, Khwaja Khuda Baksh, Mahbub Ilahi, his descendant, settled at Chachran Sharif which may now be regarded as the head-quarters of the Bahawalpur State religion.

The Chishti tenets do not appear to differ materially from those of the Sayads of Uch, with whom they are in accord. Mohammad Aqil displayed many miracles and in his old age, owing to his spiritual enlightenment, had no shadow, so he used to come out of his house on dark nights only, so as to conceal his sanctity. A cloth (lungi) which passed through his body is kept as a relic to this day. One of his Khalifas was Maulavi Sultan Mahmad, whose shrine is at Khan Bela This saint was fond of missr, a kind of bread, of fowls and of snuff, in his lifetime, so these are oflered at his shrine—a clear instance of anthropolatry, which may be compared to the offerings made to Birs. The Sufis, or devotees of the Chishtia sect, have a number of sings (kafis) which they consider the food of the soul. Their principal poets are Bulha Shah, Ghulam Shah, a Sindhi, and Khwaja Ghulam Farid, late Sajjada nishin of Chacharan Sharif. The Chishtis, generally, are devoted to music. Outwardly the followers of the Sajjada-nashins of Chacharan, who included the late Nawab of Bahawalpur Sir Sadiq Mohammad Khan IV, are distinguished by a special head-dress, the Chachran wala top, or hat, which is shaped like a mosque and is about 15 inches high, covering the cars and neck.

The Chishti revival.—The decay of the movement headed by Bawa Farid Shari-ganj had become marked, when Khwaja Nur Mohammad Qibla-i-Alim, a Punwar Rajput of the Khalt Itbe, revived it. Ihis saint was a disciple of Maulana Fakhar-ud-din Muhib-ul-Nabi of Delhi. He had miraculous powers and once saved the sinking ship of one of his disciples, his print being able to leave his body at will. He had promised another disciple to pray for him at his death.

and though he pre-deceased him, re-appeared in the flesh and fulfilled the promise. It would seem that in a sense the rise of the Chishti sect marks an indigenous revival of Mohammadanism, under religious leaders of local tribes, instead of the older Sayad families. Thus the Biloch tribes on the Indus are often followers of the Chishti saints, but even the Sayads of both branches recognized their authority. And from the earliest times religious leadership was not confined to the Sayads as the following instances show.

58. Tribal shrines.—The Kobhars have a tribal shrine, called Sultan Yakub, at Kot Sabzal, to which they bring the new grain after harvest, recite prayers and eat together. The Bohars (a Punwar tribe) have the shrine of Khanda Bohar, or Khandu Shahid at Bohar. A woman of the Veha caste fell in love with Khandu and the Vehas killed him. His shrine consists of a wall round his tomb without a roof, and is especially efficacious for the cure of cattle-disease of all kinds. Another Bohar shrine is that of Jamal or Jamaldi Shahid, at Marvat. His tomb however is visited by Hindu Kirars as well as by Mohammadans. The Bohars also have the shrines of the five Shahids of Bar at Rohri, named Dudh, Bangan, Hadar, Chus and Miran. In the time of Sayad Jalal the Bohar and Nech tribes were converted to Islam, but continued their inter-tribal warfare so the Sayad arranged that they should intermarry. The Bohars obeyed, but the Nech killed their Bohar son-in-law when it came to their turn to give a daughter to the Bohars, and in the fighting which ensued the Bohars lost 22 chiefs, including these five Shahids.

59. Sheikh Hakim Sahib,—Sheikh Hamid-ud-din Abulges Hakim, an Uavoreshi, was the grandson of Sheikh Ahmad Sahib Tokhta whose tomb is at Lahore. His shrine is at Mau Mubarik, the site of an ancient Hindu city. He married the daughter of the Emperor Shams-ud-din Altamsh, having corrected the defective orientation of the mosque at Delhi built by the latter. As her dowry the Emperor sent seven Hindu artizans, one of whom was a Totan by caste. On him the Sheikh conferred the power of curing hydrophobia, which the Totans still effect by blowing on a piece of bread which the patient swallows. The seventh tribe was the Ganga, a branch, it is claimed, of the Janjuas. The mujawars of the shrine are the descendants of Zain-ud-din, a Jogi converted by Sheikh Hakim. Ata ghata is performed at the shrine, and nauratras or vigils for nine nights, and chaupahras, vigils for four watches or 12 hours, are observed by its worshippers.

There is another shrine at which nauratras are observed. This is the tomb of Sultan Sahib, Gandiwala, whose name was Sultan Wali Mohammad, an Awan of Multan, and who used to sit, it is said in the company of girls of the Jhullan tribe, to conceal his piety. Clearly we have here some connection with the cult of Devi, for the shrine is still especially frequented by women. Music is iorbidden at this shrine.

Moghat Shah.—This saint was a grandson of Sheik Hakim and his tomb is also at Mau Mubarik. Beardless men vow to offer a hen here if they grow a beard.

60. Zahir Pir.--This numen, or manifestation (it is difficult to find a word), has re-appeared three miles to the east of Bahawalpur, at a ruined village on the Sutlej. A Jat had a vision in which the saint appeared and said he had determined to remain no longer concealed; and that whoever came to his tomb should be cured of all ills and exempted from visiting the Khwaja of Ajmer. The Jat under the saint's guidance dug in the sand until he discovered a tomb of masonry. People flocked to the spot and the Jat was in a fair way to make his fortune, when the Bukhari Sayad Makhdum of Uch intervened, and laid claim to the tomb. However the Jat has been made mujawie, and the income will be shared between him and the Sayads of Uch.

Sheikh Abdusatar.—The above is an instance, possibly, of the revival of an old and disused cult. Another instance is afforded by the shrine of Abdusatar, a Pohar by caste, of Sahwan or Sewastan, which is near Garhi Ikhtyar Khan. This saint was a disciple of Bahauddin Zakria and was killed by robbers. For five centuries, it is said, the cult remained dormant, but Ico years ago it was

resuscitated by one Noman, to whom the saint had appeared in a dream, with considerable benefit to himself, and it is now much frequented. The shrine has no roof, being surrounded only by four walls, and the fair lasts from Chet 1st--22nd.

Baithak Maula Ati .-- Outside the Marvat fort is the sitting-place of Maula Ali, a long platform made of marble, on which are the marks of his hands, thighs and feet. The marks of a horse's feet are also visible. There is also a white stone, which it is said was once butter made of camel's milk which the saint petrified when offered to him, as it was rank. Since then butter is not made of camel's milk.

CHRISTIANITY.

61. Christianity.—The Christian population, as a whole, shows a marked increase of 33'3 per cent. The total Christian population now amounts to 71,854 souls, of whom 38,513 are Native* Christians, whose numbers have risen from 3,912 in 1831 and are now nearly twice as numerous as they were in 1891.

Leaving aside for a moment the European elements and confining attention to the Native Christians, it may be of interest to discuss the figures for the latter in some detail. Between 1881 and 1891 the Native Christians added 15,838, and since 1891 they have added 18,763, to their numbers. This increase is practically confined to the British Territory, for we only find 285 Native Christians returned in all the Native States. The British Districts which show the largest numbers are given in the margin, and no other District returns over 1,000.

	Distri	at.		Native Ch	ristians.
				1901.	1891.
Sialkot	*** (10,662	9,711
Chenab Cole	on y	***		8,617	***
Gurdaspor	***	***	***	4.198	2,069
Lahore		***	***	2.990	1.397
Gujranwala	***	***		2,681	2 246
Dethi	***	***	***	2.042	831
Amritsar	***	***		1,492	959

The most noticeable increase is in Delhi, but with this exception it is clear that, as in 1891, the progress of Christianity is confined to the western portion of the area where the influence of Sikhism has been most powerful. Ambala (959 souls) and Hoshiarpur (785) come next, sed longo intervallo, and these and other districts show but small in-

creases.

As to the original castes of the Native Christians our information is necessarily imperfect, for the rule of 1891, that no Native Christian was to be compelled to return the caste if he had abandoned it on conversion, was retained. Our returns, however, show that 8,033 sweepers or Chuhras are included in the above figures. It may indeed be safely assumed that this is a low estimate of their numbers, for many Districts return no sweepers as Christians-and others only a few : for example, only 914 are so returned in Sialkot, although in 1891 it was noted that the majority of the Native Christians in that District were of this caste. On the other hand, in Gujranwala four-fifths of the Native Christians are returned as sweepers.

The figures for the sects of Native Christians will be found in Table XVII, Volume II. Deputy Commissioners were requested, before the Census, to circulate a printed letter to ministers of all denominations inviting their assistance in obtaining a complete and accurate record of the Christian sects, but nevertheless 15,006 persons among the Native Christians return no denomination.

Denomination. 1901. 1891. Anglican Communion 15.210 5,527 Baptists Presbyterians 466 340 ... Roman Catholics Unspecified ... 2,691 3,497

The marginal figures also show that the Anglican Communion (equivalent to the 'Church of England' and Protestants, ' sect unspecified, entries of 1801) has progressed most, while the Presbyterians show an apparent decrease of 54'9 per cent.

[.] This figure includes 4t Goanese classed as Native Christians.

Amongst the Native Christians the Roman Catholics are most numerous in the Chenab Colony (1,215), in Lahore (431), in Sialkot (270), and in Ambala (99). The Presbyterians are now most numerous in the Chenab Colony (United Presbyterians, 1,442 and American, 121).

The Church of England entries are most numerous in the Chenab Colony (2,292) and in Lahore (978). Protestants ('sect unspecified') are mostly returned from Sialkot (4,925), Gurdaspur (1,508), and Amritsar (609). The Baptists are virtually confined to Delhi (277) and Ambala (108). No denomination of any kind was returned by 4,994 Native Christians in Sialkot, 2,149 in Gurdaspur, 1,927 in the Chenab Colony, 920 in Lahore, and 652 in Delhi.

POPULAR RELIGION.

I shall close this chapter with a few discursive notes on popular religion, a vast subject, on which at present we have everything to learn.

62. The definitions of 'religion'-I forget how many definitions of religion are extant but a recent writer has collected a number of authoritative definitions, no two of which agree. If then we find that the greatest thinkers are unable to define the term we may be quite certain that we shall not find it used in any well-defined or strictly definable sense in India. It has been well said that :-"From the lowest to the highest creatures, intelligence progresses by acts of discrimination; and it continues so to progress among men, from the most ignorant to the most cultured," and the key to much that is obscure in the customs of backward races lies beyond all doubt in the recognition of this truth. Just as among the less civilized peoples the distinctions between political sovereignty and proprietary right, between the rent paid to a landlord and the revenue paid to a ruler, are ill-defined and to the present day hardly understood by the more ignorant of the village population, so in primitive religions one finds no clear distinction between natural and supernatural powers. The small-pox or a dream, madness or religious ecstasy, are regarded as the effects of similar causes. and those causes are conceived of as deities. But though when used in connection with the earlier beliefs the term religion cannot, in the nature of things, be strictly defined, it is necessary to have a working definition of some kind, and by religion we may understand "a propitiation or conciliation of fowers superior to man

which are believed to direct and control the course of nature and of human life."

The olden Bough, I, page 63.

In this sense it will readily be perceived that religion is opposed in principle both to the nature of the 'powers superior to man,' and it leaves us free to investigate the beliefs of the people which may include religion on the one hand and magic on the other.

But primitive religious systems do not confine themselves to religion, and beliefs. "In connection with every religion, whether ancient or modern," wrote the late Professor Robertson Smith. "we

The Religion of the Semites, page 16. find on the one hand certain beliefs, and on the other certain institutions, ritual practices and rules of conduct," and indeed, not only is there a connection between political and religious institutions, but "it

1bidem, page 21. would be more correct to say that they were parts of one whole of social custom.

Religion was a part of the organized social life into which a man was born.....?

Religion was a part of the organized social life into which a man was born....."
To rightly understand what is involved in labelling a man as a Hindu or a Sikh
it is essential to grasp this principle, that religious and social life in India are
inextricably connected and that the terms in use denote a great deal more than
we usually mean by religious beliefs. Thus it becomes clear why we cannot define
religion or sect. We have no word to express the mass of beliefs and customs which
adherence to a religious system involves in India, because we have nothing precisely
corresponding to it in modern Europe, and so we must be content to use the
word religion as defined above and bear in mind all that it implies.

The Census Commissioner asks:—"What are the actual working beliefs of the ordinary man? what are his standards of right and wrong, and what does he

suppose will happen to him if he disregards them?" It is difficult to express in every-day language the vague mass of ideas which go to make up the religious beliefs of the people. In a system of religion where innumerable superstitions, magic, and various quasi-physiological ideas all find a place, there is little room for a scheme of ethics, and it may be said that in India popular religion has rather less to do with morality than with anything else. I am not, in writing thus, speaking of the philosophical religions, but of the ideas common to the mass of the people, whose every-day morality is assuredly not high. Yet it would be absurd to say that the ordinary man has no standard of right and wrong Altruism is concentrated on the caste, the tribe and the family, in a way that it is hardly possible for us to understand, and it is all the more intense for being so concentrated. We are accustomed to find fault with the lack of public spirit observable in many local bodies, but we forget that the ties of the joint family demand far greater sacrifices from the individual than is the case in the west. And this devotion to the family is not confined to the higher castes of the Hindus, the Brahmans, Khatris and a few others, which have family gods and a domestic cult, but it is found also amongst agriculturists whose religious observances are practically confined to attendance at fairs, with an occasional pilgrimage, and amongst whom adherence to a sect mainly consists in a periodical visit to, and the making of suitable offerings at, one of the numerous shrines.

Again we are accustomed to regard the Punjab peasant as litigious in the extreme and utterly unscrupulous in his character as a litigant. It must indeed be allowed that he is not an edifying spectacle in the witness-box and that organized perjury is one of the greatest obstacles our administration has to face. Yet on the other hand there is an increasing tendency to fix rents in kind and that system could not survive for a year if both parties to the contract did not act in perfect good faith and trust each other to so act. Commercial morality is not at precisely a high ebb in India, (whatever it may be elsewhere), yet the stamp revenue suffers enormously from the fact that probably not one trade contract in ten is reduced to a formal document. There is a curious contradiction between customary morality and abstract. On the former almost implicit reliance may be placed. The latter hardly exists, for popular religion does not, speaking generally, teach it and there is nothing to take its place. Herein indeed modern popular religion closely resembles the Vedic system without the ethical deities. Varuna and Mitra, to whom a Semitic origin is probably to be ascribed. The divine manifestations which form the objects of popular worship have, as a rule, nothing to do with ethics; human actions are controlled, not by them, but by the stars, or by omens and auguries Even when we meet with exceptions, we find moral precepts subordinated to, or at least only put on the same level as, ceremonial observances. Of this an excellent illustration is afforded by the Bishnoi tenets "Bathe in the morning. Commit not adultery.' The two rules stand on an equal footing.

But if popular religion has but little to do with ethics we have no right to say that the inner religions, of which we know nothing, exclude them. 'It is Certain,' says Mr. Andrew Lang, 'that he mysteries of Eleusis were survivals of savage ceremonies' yet 'there was something taught at Eieusis which filled minds like Plato's and Pindar's with happy religious awe.' We may conjecture that behind the mysteries of the Earth-god, now worshipped as Sakhi Sarwar, lies some teaching of which we have no knowledge.

Again when we come to consider the actual religious beliefs of the people we find ideas which are at once like and unlike the speculative metaphysical doctrines of the religious teachers and orders. Of these ideas the most prevalent if not the most important is the conception of the life or soul as a something impalpable, impersonal, but real, and this idea appears to lie at the basis of what is called Animim.

63 Animism — Animism (trom Latin anima, 'life, soul') was the doctrine of the anima mundi upheld by Stahl (A. D. 1720); the doctrine that the pheno-160

mena of animal life are produced by an immaterial anima, soul, or vital principle

Middle 8. Animism., Oxford Dictionary.**

Primitive Colture, I, page 4455.

This term. originally originally originally animal principle.**

Primitive Culture, I. page 485

This term, originally applied to an abstract philosophical doctrine, was adopted by Tylor for 'the deep-lying doctrine of Spiritual Beings, which embodies the very essence of Spiritualistic as opposed to Materialistic philosophy.' Using the term in this sense, Tylor points out that 'animism characterizes tribes very low in the scale of humanity.'

It is perhaps open to doubt whether, in this sense, animism is the earliest form of religion. It is not an abstract philosophical or Spiritualistic doctrine, but a vague idea that the life or breath has a distinct existence and can be separated from the body which forms the earliest animistic belief. As pointed out in Primitive Culture the notions of life, heart, breath and phantom all unite in the one conception of a soul or spirit, and the very words used are the same, as in the Urdu atma, ji, jan : and in phuka, the last a Kangra word meaning ' breath' or 'person.' These words are not used metaphorically as equivalent to soul or spirit, but literally, soul or spirit, and life and breath being regarded as one and the same thing. There is no distinction between them. In this sense animism is exceedingly common and lies at the very root of popular religious conceptions. When it is once realized that primitive religion confuses life and spirit, or rather has never advanced so far as to be able to distinguish between them, it becomes easy to understand why anything that lives may come to be worshipped, especially if it shows a superabundant or abnormal vitality. Thus a large tree, or a whole species, if the tree be one which has special qualities, such as the power of growing in barren soil, or a pungent smell, may come to be regarded as having an extra share of vital essence and so endowed with 'soul.' And from this starting-point it does not appear difficult to follow the development of religious ideas.

64. The Metempsychosis.—As primitive religions have no conception of the distinction between the soul and the life, they reason, logically enough from their standpoint, that, precisely as physically life is transmitted, so too is the soul transferred from one generation to another, and with the life transmigrate, as it were, all the attributes and powers of the progenitor. On this theory it is quite easy to explain the transmitted hereditary power of curing disease or causing evil by means which we may call supernatural. This belief is extraordinarily common as the following instances show:—

The Biloches have several sub-divisions who can stop bleeding by reciting

2			0010101		a

a stop bleeding by reciting charms and touching the wound, and they used to have the power of bewitching the arms of their enemies so that they became useless. In his translation of the Bilochinama Hetu Ram says:—

'The Nothanis are the Levitical section of the Bugtis and guardians of Pir Sohri's shrine, though they have admitted a Gurchani to a share in the guardianship. Before an expedition each man passes under a yoke of guns (or swords) held by men of the Nothani section. They can charm guns so that the bullets shall be harmless and get (or claim) a share of all crops grown in the Bugti country.' The Usranas of Khui Bhara in Kulachi Tahsil have similar powers.

Numerous Pathan sections have similar powers. In Musa Khel, in Dera Ismail Khan, the descendants of Murat, of the Moi Khel, can cure burns by applying their spittle to the wound, and reciting the formula, 'Bismilla-ur-rahman-ur-rahm.' The power was conferred by a Hindustani faqir. The Khwaja Khel received a similar power from an Indian faqir, and can cure pain of any kind by blowing in a piece of salt or sweetmeat and giving it to the patient. Among the Niazis is a sept called Sarang who cure jaundice by blowing on grains of white jawar, which the patient eats. This power was

bestowed by Mian Khwaja Sahib of Mian Bagh, at whose shrine is a sarin tree, and by eating its leaves on the sankrant of Baisakh one becomes immune from rishta-narru (a disease) for as many years as one has eaten leaves. tomb also has a general power of healing. Another Niazi sept, the Michan Khel, is descended from Michan Baba, and has three sub-septs, the Badni, Gorki and Aka Khels, which have varying degrees of power to cure hydrophobia and snakebite, and visits to the tomb of the Bawa also secure immunity from snake bite. The Bura Khel of the Bhitanni comprises six or seven families claiming Sayad descent but believed to be Mullagaurs, who can avert the enemy's bullets in war, and the Shaki sept can cure any disorder if seven members of the sept pray for the patient and spread a chadar or sheet over him.

This sept is paid for its services. In Tank is a sept called Taib, near Gambila, also claiming Sayad descent, but probably of Bhitanni origin, who can cause rain by their prayers, and avert misfortunes. Among the Gandapur is a Musa-zai sept which cures cataract, and another sept, called Bura, cures pains by striking the part affected with an iron implement. Three visits must be made. A third sept, the Ibrazai can cure a disease called dur, by blowing on the wound two days, the cure resulting on the third. Among the Babars is a sept, Akhund-zai, of the Bawan-zais, who can cure snake-bite and hydrophobia: they write a charm in three wooden vessels, wash off the writing with water, and make the patient drink it. This must be done by them gratis, but the carpenter who makes the bowls may be paid, and an essential condition is that no other treatment, before or after, may be tried. The Ushtarana Pathans, by origin Sayads, can give immunity from weapons in battle, and the Hari-pal sept of the Shirannis have a similar power, and claim a similar descent. Finally some of the Oasranis practise divination from the shoulder-blades of goats, and take auguries from the cries of birds.

Various other tribes have similar septs with these curative powers. The Sheikhs of Gandi Umr Khan in Tahsil Kulachi cure ulcers by reciting a charm and touching the part. The Mahar Jats in Bahawalpur can cure sore throats, by rubbing salt with the ashes of cow-dung on the patient's neck. The cure is instantaneous, and the belief said to be general in the Punjab. The Ganglis of Khan Bela have a similar power. A Hindu Arora of the Chugh got can cure chuk or pain in the loins, by pushing the sufferer from behind. If a Chugh is not on hand, it is sufficient to go to his house and rub one's back against the wall. Chugh may be derived from chuk, because the tribe has this power, but perhaps the idea is simply that a Chugh has power over chuk. Imitative magic finds scope in the following rite:—If your field be suffering from mula or blight, call in a man named Mula Mal or Mula Ram and drive him from the field, beating him with shoes a tergo. Then as Mula runs away, with lamentations, so too will the blight depart. The Dua section of the Aroras have also an inherited power of curing a sprain in the back or loins by touching the part affected. The pain called chuk may also be cured by this section which uses the following charm:—'Dua sith bari, phulon bhari dari, bhanne chil (waist) karenda sari.' The charm is read over a cloth and this is then applied thrice to the part, a push being finally given to it to expel the pain, The power was conferred on Seth Hari, the ancestor of the section, by fagirs. It is also said to be essential that the patient should go straight home without looking back. The power is exercised gratis.

But these powers, though most common in the south-west of the Punjab, are by no means confined to that area. For instance the Pathals of Phaphil Raja Ram in Jhelum cure boils on children's heads gratis, by first filling the mouth with salt and then spitting on the sore, and the head of the Paswal Gujars at Jakkar in that District cures a skin disease which causes baldness by pulling out a single hair. He practises on one Sunday in the month and must not accept any fee because that condition was made by the fagir who conferred the power some generations ago. Thus too the Khatris of

A child born feet foremost can cure pain in the loins by kicking the part affected. Was the orogenitor of the Dua Aroras so born? min Hissar this section of the Aroras may not wear blue lenghs (trousers).
162

the Asri section at Sankhatra in Sialkot can cure snake-bite by reciting charms and touching the person bitten with <code>drek</code> leaves. Among the Jats the Səlehria of Sidhwan in Tahsil Zafarwal can cure ulcers by administering pepper charmed by them on a Sunday or Tuesday. Sadhu Ram Das conferred this power on them. In Patiala the Bat Khatris of Bhiwanigarh cure enlarged glands by touching them with a pen dipped in ink. And the males of the Sungal <code>got</code> of the Banias of the same tract can cure sores by touching them with salt. Among the Sonkhla Rajputs of Una Tahsil the descendants of one Sangu have the power of curing small-pox by inoculation. The power was conferred by a <code>fagir</code>. The Nagiana or Nangiana, (the play on the words <code>nag</code>, snake, and <code>nanga</code>, <code>naked</code>, causes constant confusion in beliefs), of Shahpur, are also believed to be able to cause injury. The popular derivation is from <code>nag</code>, because they have that power. The Ghiraths have a section called Rihara, which has hereditary power to inflict evil.

The sacred clans.—Some of the septs described above are almost priestly in character, and it is indeed difficult to draw the line between their functions and those of some of the sacred clans. Of these latter instances are numerous among the Pathans, among whom each tribe has, as a rule, a Mian Khel, a Faqir Khel, a Baba Nmasi or a Khwaja Khel, which often claims to be, and perhaps sometimes is, a Sayad family affiliated to the tribe, though for the most part these septs appear to be by descent branches of the tribe. Other instances are furnished by the Khatris, and Gujars, who have sacred sections which will be noticed later. The Lobanas also afford excellent illustrations of these clans: the Piliya or Makhan-Shahi section of that tribe is regarded as holy, some of its members being gurus or teachers of the tribe: the Datla section is snake-descended and takes precedence in worshipping the snake: and lastly the tribe has, in Jhang, the Sikka-Bhiana section of the Khatris, as its hereditary gurus. The Gaddis again have a section the Bararu, possibly totemistic, called indifferently Brahmans or Bhats, whose members fulfil Brahminical functions for them, and numerous other instances could be given.

These sacred clans again gradually shade off, as it were, into the secular clans, so that we find some septs performing half sacred, half menial functions. Thus in Jhang there is a sub-division of the Lun called Bala, members of which celebrate marriages, wash the dead, and so forth, and act more or less as mullahs. We even find this hereditary principle extended to the victims in human sacrifice, for the victim in the Bihunda sacrifice in the Sutlej valley must always be a man of the Beda (which possibly means 'ram') caste.

This principle of inherited supernatural powers or sanctity is much more deeply rooted than that of caste. It is natural and fitting that a man should follow his father's trade, but he may change his occupation. His doing so will involve loss of status, if he takes to a degrading trade, but a Sayad may become a policeman, or take to evil ways, and remain a Sayad: and a Brahman remains a Brahman whatever his secular occupation may be, provided it does not out-caste him altogether. When once sanctity has been acquired by a family it is next to impossible to shake it off. Social status is much less permanent.

The Transmigration of Souls —The original conception of the metempsychosis appears then to have been that the life or soul, with all its attributes, was transmitted by natural descent. This idea was developed into the doctrine that the soul transmigrated from one body to another independently of such descent, but this doctrine did not regard transmigration as something fitful and uncertain; on the contrary religion held that it was subject to one set of rules, and magic that it could be regulated, but in neither case was transmigration a matter of chance.

65. Magic and Religion.—Starting from precisely the same point we may conjecture that magic and religion diverged into two distinct paths. On the one hand, the magician claimed to be able to manipulate the vital essence : on the other, the priest maintained that the devolution of the soul could be modified or controlled by the pious or just man who observed the precepts of religion. On this theory it is possible to account for many beliefs.

Magic.—The claims of magic are unlimited, and the powers of the magician only depend upon the degree of proficiency in the art to which he has attained. Apparently, as soon as man realized that he could, in a very small degree, modify or control the forces of nature, he sprang to the conclusion that, if only one knew how to set about it, there was no limit to what could be done in that direction. When it was once discovered that life was transmitted, it was but a short step for magic to claim that, by taking the proper measures, its transference could be controlled, and as one of the most deep-seated instincts is the desire to perpetuate the family, magic soon set to work to devise various, and sometimes indescribable, cures for barrenness. For that evil some of the more respectable remedies are to catch the soul of the dead, with various rites : as, for example, by bathing over a dead body, or eating a loaf cooked on the still burning pyre of a man who was never married (and so never transmitted his life), and who was the only or eldest son in his family (and so received the fullest possible measure of vitality). These rites assume various forms, but whichever one be considered it will be found that the principle is at bottom of the same. Thus: (i) On a Sunday or Tuesday night or during the Diwali Festival a barren woman desiring a child sits on a stool, which is then lowered down a well. After divesting herself of her clothes and bathing, she is drawn up again and performs the 'chaukpurna' ceremony with incantations taught by a wizard. Should there be any difficulty about descending the well, the ceremony is performed beneath a pipal tree. It is believed that after such a ceremony is performed the well runs dry and the tree withers. (ii) On the third night of the Diwali Festival a woman desiring a child cuts a lock of hair surreptitiously from the head of a first-born child and takes it to a wizard. A charm is made, which the woman either wears round her waist or buries in her house.

In all these cases the idea is to extract the principle of life from the well, the tree, or the first-born child of a neighbour.

Religion.—Religion, on the other hand, deprecated any such impious interference, with the laws of nature. It maintained that, while, in the ordinary course of things, life was transmitted from one generation to another, superior sanctity could secure promotion on re-birth into a higher caste, while impiety was punished by re-birth in a lower form of life. Religion also adopted the view that life and spirit were one and the same thing, that that principle was inherent in every living thing, and from this basis appears to have been evolved the metaphysical doctrine of the world-soul, which pervades everything in the universe, of which the individual soul is but a detached fragment, and into which it will be reabsorbed. This doctrine is reconciled with that of the metempsychosis: as, for instance, in the Granth, for therein frequent allusion is made to this belief, the soul that is subject to maya or illusion being condemned to re-birth, whereas the one which is free from maya is absorbed in the Supreme. The belief is, however, by no means confined to Sikhism, for it finds expression in various Hindu customs and ideas.

The popular beliefs, however, do not regard the powers conferred by sanctity as limited to spiritual matters, and so every sacred personage is supposed to have a peculiarly extensive control over the vital principle, so that his sanctity is often manifested in the power to bestow children upon his suppliants. Indeed exceptionally holy people are held to be overflowing with this principle, so much so that in spite of themselves, unconsciously and without an effort, they dispense physical offspring or spiritual power, and the latter infects everything with which they come in contact, and is inherent in everything which emanates from them. For example, Mr. Maclagan quotes an instance of shoe-worship, a perfectly reasonable and logical deduction from the premisses that the super-abundant spirituality of the teacher could spread even to his more menial garments.

66. Deified teachers.—It may be said that in almost every religion we find at work two great and irreconcilable principles, to whose hostility may be traced the great schisms. The first of these is the doctrine of inherited sanctity. There is in the human heart not only a natural desire for some Mediator, but a demand that that Mediator shall be always present, a visible and tangible personage. The doctrine that sanctity is inherited meets this desire, and so in most religions we

find a family, a tribe, or even a caste in which holiness is hereditary. By a slight modification of this doctrine we have in certain religions a line of spritual personages whose succession is not governed by natural descent, but depends on a series of re-incarnations. Instances of both these allied principles have been given in this chapter.

It will be at once seen that this doctrine may easily develope into anthropolatry, and excellent illustrations of this are afforded by taking up at random almost any book on sects. For example, the Charndasis have the following tenets:

'He who regards the Guru as a mere man is as one who takes the elixir for water. He will be born a dog time after time. He will fall into hell. From God's anger there is a refuge; from the Guru's none. The Guru is greater than God, for God's works are on the wrong side of the ocean; the Guru's have passed to the opposite shore. By his favour the clouds of love (prem) discharge their water, and suffuse the whole man.'

It is further clear that when once this doctrine has become established cases of disputed succession to the inheritance of spirituality may arise and lead to the formation of numerous sub-sects, instances of which will be found in several of the preceding paragraphs.

To this principle of inherited sanctity there is strong opposition in almost every case. It is contended that, whatever the merits of the spiritual teacher may be, he is and must always remain human, and that his natural descendants, though entitled to reverence, do not inherit any super-human sanctity. Examples of this rationalistic spirit may be indicated. It is found among the Sunnis (vide paragraph 43 supra): and among the Sikhs, for among them only the Sahjdhari Sikhs do obeisance to the Sodhis and Bedis who are descendants of Gurus. It would further seem that the Tapagachha Janis do not recognize any line of Jinas, a title which appears to imply that the Kharataragachha sect of that community regards its pontiffs as re-incarnations of the Arhats or Tirthankaras who were divine. The religion of Buddha began by denying the existence of the soul, and it has developed, at least in Tibet, into Lamaism, a creed whose cardinal tenet is the endless

Rhys David's American Lectures on Buddhism, re-inCa pages 39:41 and 198.

re-incarnation of the divine leader in a succession of lamas or deified men, a relapse

into the ancient doctrine of the metempsy chosis.

Thus the Lamaists are an instance of that tendency to degeneration in religious doctrines which has played an important part in the history of religion, as will be seen presently.

67. Spiritual relationship.—In all religions, it would seem, the religious leader is regarded as a spiritual father, and as such is the indispensable mediator between the worshipper and the worshipped, unless indeed the mediator displaces the latter and becomes himself the object of worship. Thus is created a system of spiritual relationship, known as Pir-muridi among Mohammadans and Gurusikhi among Sikhs. But the mediator need not belong to one of the great religious castes, such as the Brahmans and Sayads, and so it comes about that the religious business of many tribes is carried on by a two-fold agency, the Brahminical, and doubtless older, agency being retained for the religious ceremonies so inextricably connected with social life, and the newer spiritual agency superadded. Nothing could illustrate this better than Mr. Purser's account of the Hindu priesthood in Jullundur:—

"For the proper performance of his religious duties, a Hindu must have three Jullandar S.R., page 53.

Bráhmans, First is the parchil, whose principal business is gracing the ceremonics with his presence and taking fees. If he knows anything, so much the better, he can assist actively: but, if not, it is of no consequence. But besides executing the duties of the religious office, he is greatly in request as a messenger between the families of the husband and wife, for it is highly improper for one of the former to go into the village of the wife's parents. Next is the Fándha or Fádha, who must be a learned man, or at least must be theroughly acquainted with all rites and ceremonics over which he presides, so that nothing may be done amiss. Finally, the Acháraj, whose business it is to see that all obsequies are properly performed.

Besides these a Hindú may have a guru, or spiritual teacher, who need not be a Bráhman. But very few think him accessary. The three Bráhmans have got their regular customers by whom they are employed when their services are needed, and do not practice promiscuously. One great duty of Bráhmans is to be the recipients of alms. This duty is generally taken by Bharáis among the Sultánis, but none of the other offices of Bráhmans devolves on them. The Bráhmans do not interfere in the every day life of the villagers. They come forward only on certain fixed occasions, such as marriages, desths and obsequies. Sádhs are Sikh devotees who collect and distribute alms, read the Granth, and occasionally give instructions in it."

This system appears to be common to both the high and low castes in all the religions. The guru of the Hindu may be a Bráhman, but probably, in the great majority of cases, he is not. He may be a member of a religious order, even of a Mohammadan order. So too the pir of the Muhammadan is usually, but by no means invariably, a Sayad, various other sacred clans such as the Bodias, Khaggas, Jhanders and others, furnishing pirs to Mohammadan tribes. But amongst Mohammadans the pir is invariably a Mohammadan, though Bráhmans may be employed for social ceremonies. Similarly the Jains have Sadhus (Jain-Sadhus) of their own as priests, though some of them continue to employ Bráhmans for ceremonial purposes, and amongst the Sikhs generally the position of the Bráhman is the same. The choice of a guru or pir is not confined to any particular caste, for the Sikh Jats have chiefly Khatris of the Bedi and other sections as their gurus, but amongst the lower castes the guru is usually a member of the caste. Thus the impure castes which are hardly within the pale of Hinduism not only have low-caste Bráhmans of their own, but also employ priests of their own castes. For example, the Megh of Sialkot and the Jammu border are almost ruled by a guru of their own and have caste-priests called Gorais: but they also employ Bráhmans 'of low status.'

Thus too the three Chamar sub-castes, which do not employ the Chamarwa Bráhmans, have masands, or celibate priests of their own caste. Among the Dhanaks certain members of the family called Dhana preside at marriage ceremonies.

These caste priests usually remain members of the caste to which they originally belonged, but intermarriage between the priest or sinda-pir and his disciple is often forbidden. Thus among the Rajputs, Pathans and Khojas there can be no marriage with the families of their Sayad Pirs, but the Sikh Jats many intermarry with Udasi Sadhus and the Chamars with their masands.

Thus among the higher castes spiritual relationship stands in precisely the same footing as natural descent, and involves all its consequences.

68. The inner religions.—The tendency to protect unpopular religions dogmas by making them secret, or to enhance their value in popular estimation by revealing them only to the initiated, probably accounts for the existence of the various secret sects or orders so often found. In nearly all religions we have these concealed doctrines. Thus the Jogis of Tilla have a lamp, kept perpetually burning, to which reverence is paid by reciting a secret mantra or prayer, which is handed down from one initiate to another. Even in the most primitive cults we find traces of esosteric doctrines. Thus in Kangra the shrines of the Siddhs connected with Dewat Sidh, (vide paragraph 15 supra) have legends which point to some secret dogmas being taught to their devotees. Once a young Bráhman was herding his cattle in the forest when he met a Gosain who forbade him ever to reveal their friendship. Disobeyance was punished by insanity, which was only cured by the power of Balak Rupi, the saint who had taken the form of the Gosain. A similar legend is told of Birag Lok's shrine, in which the penalty for disobedience was more severe, for the youth was turned into a stone, but this punishment elevated him to divine rank, and as he had been a cow-herd he became a god of cattle. It seems almost indisputable that these legends, puerile as they appear to us, are in reality the débris of old allegories. The Gosain is god: the lad the human soul in secret communion with

A 6-8-6

^{*}Massed is usually derived from the Arabic massed, but in Kangra it appears to mean florg-haired, and is used of converts to Sikhism. It is there the name of a Ghirth sept.

166

Him. Precisely the same idea is the basis of the Cupid and Psyche legend, and the allegory takes a slightly different form in the Dulha Deo cult, transformed into the Naushahi mysticism (vide paragraph 29 supra.) How otherwise these legends could be explained I cannot see, and if these explanations hold there is much to be said for the degradation theory of primitive religion.

If we knew more of this inner religion, which is reproduced for popular consumption in these allegories and legends, which then become themselves accepted as religious doctrines, we might be able to explain many instances of the worship of attributes. The process may be conjectured to be this,—first to the attribute is assigned a mystic meaning, which results in its being 'reverenced by the initiate: then the uninitiated worship it blindly in ignorance of its mystic significance: finally all recollection of the meaning is lost, and only the blind worship remains. It is not easy to see how men could worship a whistle or a personified whistle or a whistling god, (paragraph 28 sapra), but it is not so difficult to understand that they could begin by making a whistle the emblem of one attribute, and end by converting the emblem into a god who whistles.

- 69. Tabus.—An institution, (it has serious claims to the title), which plays an important part in the life of the people is the institution of tabu. The number of tabus is endless, and the results in many cases important. Thus the Nagra Jats of Nagra in Ludhiana may not build a chaubara or upper storey to their houses, because it brings bad luck to do so, and Papora village in Bhiwani Tahsil contains no chaubaras owing to a legendary occurrence. No Sangwan Jat in the 57 villages held by that tribe in Daori may cultivate cotton. To certain sections of tribes certain days are tabu. At every turn the business of life is hampered, and even direct loss incurred owing to these ideas. The confusion of thought, characteristic of primitive people, makes them regard anything which has been subject to supernatural influence as holy or accursed, without distinguishing between sanctity and the reverse. Thus whether a thing has brought good or evil fortune it is equally infected with supernatural power and so must not be used again, (paragraph 60, page 153 supra.).
- 70. Conclusion.—In conclusion I may quote a few notes from the District Census Reports which illustrate how the old order of things is passing away.

There are not wanting signs that the old personal sects and the old fanaticism are losing ground. Movements like the Arya Samaj, the Singh Sabha, and the Dev Dharm are not led by individuals claiming to be inspired or even semi-divine personages, but are organisations, founded on certain principles, incorporated under the law, and partially endowed.

Thus the Deputy Commissioner of Ferozepur writes:-

"No new sects of importance have sprung up during the past to years, but signs of decay in religious movements are visible here and there.

For instance 10 years or more ago there was always some fear of religious riots at the time of the Moharram between the two Muhammadan sects, Shiahs and Sunnis. Now not only do the Muhammadans show less interest in the display of tasias which are getting fewer in number every year, but the bitterness of feeling between the sects is not so marked.

Apparently both Hindus and Muhammadans are on the whole less inclined to listen to their refigious leaders. Scarcely to years ago there were many Kukas in this District, some of whom were Subas (or local chiels) through whom homage was paid and presents sent to the successor of Ram Singh, the Kuka leader. Now a large majority of Sikhs look upon the Kuka sect almost with disfavour."

Mr. Maclagan, now Settlement Collector of Multan, also writes :-

"The Wahabis are believed to be of less importance than formerly and the animosity between them and other Musalmans has decreased. There is a fairly marked tendency to increase in Shiaism owing to the gradual disappearance of prejudices against Shias, and increased intercourse with Shia countries." Even in the most backward Districts of the North-West Frontier Province the sevidence that fanaticism is on the wane. Thus in Bannu the Deputy Commissioner says:—

" It would appear that the influence of mullahs as spiritual leaders is declining."

And in Dera Ismail Khan :-

"The Syeds possess far less influence now than they did, and transfers of land to them by their disciples are less frequent. No information, however, as to the number of these last is obtainable from the Census record."

And where the mullah has any influence, it is devoted to secular objects, as in Kohat:—

"A few of the local mullahs attain, every now and then, to a more or less entensive popularity, but they cannot be considered as spiritual leaders or the founders of any new sect or movement. Their influence is unfortunately chiefly exercised in political intrigue, rather than in the direction of spiritual enlightenment."

It may be safely said that with political failure will come the final extinction of all influence.

In accord with these observations is the action of the Anjuman-i-Islamia of the Punjab, which in 1900 published in Urdu, Persian, Pashto and English a fatud against the practice of ghasa, demonstrating its illegality from the Qoran.

Addendum to paragraph 23.

The Bhagat Panthis—Since this chapter was in proof Captain O'Brien, Deputy Commissioner, Mianwali, has furnished the following account of this sect, whose members are called Ram Namazis by their opponents, because they pray to Ram. The sect was started in the Mianwali District, some 40 or 50 years ago, by one Bhagat Waste Ram who compiled a 'Gobind Shastar' for his disciples in Gurmukhi, though the authority of Guru Nanak's Granth is also admitted by the sect. A prayer composed by the Bhagat must be recited six times a day, facing the east, with the Muhammadan genuflexions, etc., the words 'Hari Ramji, Hari Gobind, Vishan Bhagwanji 'being repeated. Ablution (wasu) is a necessary preliminary to prayer, as in Islam. The sect allows marriage within the got or section, and the only ceremonial is a procession round the Granth (dawan), with a distribution of sweetmeat (karáh), which is also distributed on a birth. The usual Hindu ceremonies of chola and jhand are not observed, but the sacred thread may be worn, though this rite is to be performed at the Darbar Sahib at Anritsar. There are no funeral ceremonies and the dead are buried, not burnt. A dving man is seated 'like a jogi', and after death his corpse is placed in a litter (kajawav) and carried to the samadh or sacred tomb for burial, or else cast into a river. The family reads the Granth for ten days after a funeral, but all the other Hindu observances are forbidden. Ceremonial impurity also is limited to those who actually carry out the corpse, and they alone bathe. Death does not render a family impure, nor does a birth, only the mother and child being deemed to be so for a few days. Widow re-marriage is prescribed as a duty, Idol-worship is forbidden, the sect being nirgun upasak, or worshippers of god, and opposed to the surgun upasak, or idol-worshippers. The sect also believes in the transmigration of souls.

CHAPTER IV.

AGE, SEX AND CIVIL CONDITION.

PART I.

AGES.

1. The age recorded.—The instructions for the preliminary enumeration provided, as in 1891, for the record of age as it would be on the night of the final Census (March 1st, 1901) and not of the age at the time when the preliminary record was prepared.

In accordance with the general rule laid down in Article 3, Chapter XIII of the Imperial Census Code and with Mr. Maclagan's suggestion the rule laid down was that the number of down was that the number of years actually combleted—

years actually combleted—

not the current year of age-should be entered.

I believe this rule was generally understood and acted upon. The native system of reckoning by subtraction of a quarter appeared to facilitate its comprehension, and in no District did I find that the rule had been misunderstood. The rule in 1831 (but not in 1881) was to return the current year of age and the complications which resulted are fully discussed by Mr. Maclagan. It is sufficient to remark here that in 1831 all the returns for this Province had to be 'set back, as it were, by one year to bring them into accord, for purposes of comparison.' But" it was at once seen that the relative proportions of the quinquennial Surgest States of the James of Itelia, 1891. Periods had been entirely Grabo Mr. Hardy's Note, page 144 of the General Tables, volume II, disame.

on the multiples of five, all the undue excess got shifted back a period."

There could then be no hesitation in following Mr. Maclagan's view and entering the completed year on this occasion, and refraining from any modification of the figures actually returned.

- 2. Comparison with vital statistics.—There is, however, one difficulty. If the people of the Punjab habitually state the current, and not the completed year, in giving their age, it may be assumed with safety that the Death-returns by ages prepared by the Sanitary Commissioner's office are based on a different system to that of the present Census. This is a point to be borne in mind in discussing the returns of infant mortality.
- 3. Distribution of the ages unreturned.—The ages not returned were distributed according to sex and civil condition, and the method can best be illustrated by a simple example:—

Suppose a widow does not return her age, and that most widows are over 60, the probability is that she is over 60 and 1 is added to the numbers for 60 and over. The ages of a number of widows are thus distributed in proportion to the number of widows returned under each age-period. This method appears to be more accurate in its results than allowing the abstracting staff to guess at the age of a person, whose age was not entered in the schedule, from the sex and civil condition returned, because in that method there is no distribution based on probabilities but a mere guess. The number of ages unreturned was, however, remarkably small and the point is not of much practical importance.

4. The preference exhibited for certain years.—There are three chief causes or motives which lead to mis-statement of age:—inaccuracy of thought, vanity and superstition.

The first is beyond all doubt the most efficacious, in this part of India, in vitiating the age-returns. Just as distances are measured (in the hills at least), by the number of halts required to enable you to have a good smoke, (a pakka tambaku), or merely a few whiffs, (kachcha tambaku), while grain is measured by the handful and land by the quantity of seed required to sow it, so ages are not counted but described, and there is no doubt that the phrases in use convey, to a native, a much more vivid idea of a man's age than mention of his precise

age in numbers would do. Mr. Talbot gives examples of these phrases in

Jhelum phrases. ... 15-25 нан-јатап *** ... 25-40 jawan pakki umr buddha

Ihelum. While in Kurram a man's age is judged, like a horse's, by mark of mouth :- warukai ghakh, of small teeth, or under 15; mans ghakh, of middle teeth,

or 20 to 35; pokh ghakh, of full teeth, or 35 to 70. In Gurdaspur we have:—mas phutti, for 15 to 20; gabhru, for 40 to 50; satra bahatra, 'old,' lit: "70 or 72."

Obviously to ask people who think in this picturesque, but rather primitive, way to translate their thoughts into precise numbers is expecting too much.

The tendency of women " of a certain age" to understate it affects European returns and it should not surprise us to find ours influenced by it. Yet I doubt if the effect is very marked, except in the case of girls of a marriageable age for whom no husband has been found. In their case the age is probably always understated, yet the number of unmarried females over 15 returned is large, though it must not be forgotten that under the instructions unmarried prostitutes were recorded as kuari and so tabulated amongst the unmarried.

The tendency of the old to over-state their age is perhaps, to a certain extent, counterbalanced by the feeling that it is luckier to under-state one's age than to

Superstition has remarkably little effect. Amongst Hindus the 9th year is angint, or without a number, and is so called, but there is no objection to returning it under that name. Again in the case of boys the 8th and 12th years are unlucky and also called angint. The unlucky numbers, however, do not appear to be unlucky at all when used of ages. Thus 9 is neither lucky nor unlucky, though it is a multiple of 3 which is quite disastrously unlucky. 5 is very lucky and 1, 5†, 7, 11, 13, 15, 17, 21, 25, 31, 41, 51, or 101 are fortunate numbers, and indeed all odd numbers (except 3) Punjab Notes and Queries 1. \$ 127.

are luckier than even numbers, but in the Kurram Mr. Barton mentions 3, 13 and 16 as peculiarly unlucky, and says that in stating ages they would be avoided. It is a little curious that 3 has not been to any extent withheld in returning age, because in counting bahut is used for it and the shisham with its 3 leaves is a type of utter failure. 12, on the contrary, is peculiarly lucky and complete success is called 'pao bara.' 52 also appears to be a happy number, and appears in Buddhism as the number of 'the divisions of

thought, word, and deed.....all the immaterial qualities and capabilities which go
Rhys-David's American Lectures on Bod. to make up the individual.' Both 12 and 52 Rhys-David's American Lectures on Bud-dhism, P. 156. Subsidiary Table I.A. will be found to occupy a conspicuous place in the discussion on the origin of caste. They

are returned considerably in excess of any ages other than those which are multiples of 5.2 It will also be noticed that the numbers returned under the age of 8 exceed, to an appreciable extent, those returned under 6, 7 or 9. Eight does not appear to be a lucky number, though it is the number of prostrations made in the worship of the Bhagat-panthis. The eighth child is unlucky.

5. Horoscopes. - Seeing that the preparation of horoscopes is still generally practised (though it is said to be dying out in Hazara), the returns of ages among Hindus of the better classes should be exceedingly accurate. It is, however, very unwise to reveal the exact day, month or year of one's birth, just as it is

^{*} Just as the 8th month of pregnancy is unlocky.

* Just as the 8th month of pregnancy is unlocky.

* Just as the 8th month of pregnancy is unlocky.

* Just as the 8th month of the 8th and 7th are put down as of the 4th and 6th. Nevertheless, people as y:— In y person of the 4th and 6th is never the season of the 4th and 6th. Nevertheless, people as y:— In y person of the 1th and

undesirable to reveal one's birth-name. Thus any attempt to record the year of birth instead of the age would probably give us less accurate data than we have at present.

6. The age-constitution of the population (in British Terri-

					Sec	uence.

tory) .- Examining the Subsidiary Table I. A., Ages returned by 100,000 persons of each sex, (i.e., by 200,000 persons in all), we find that the sequences in each decennial period are as shown in the margin.

That is to say in the first decennium the age most frequently returned is 5, then 8, 6, 7, 4, 3, 2, 0-1, and, least frequently of all, 1-2. In the next decennium 12 is the favourite age, then 10, 15, 18, 16, 14, 13, 11, 17 and 19, but in the remaining decennia we find the tens invariably preferred, then the fives, then 22, 32, etc., without exception. The ones, threes and nines are not favourite ages, in any case, but 39 is not avoided, while the eights are generally returned only less frequently than the twos.

But turning to the figures for another 200,000 persons, whose ages I have

			5	Sequenc	e in Sul	b. Table	e I. B.			
				1	dales of	nly.

had tabulated,† we find quite a different sequence in nearly every decennium. Taking males only we find the aversion to returning ones, sevens, and threes, again very strongly marked, even in the first decennium in which the

sequence is 5, 8, (as before), o-1, 4, 6, 3, 7, 9, and 1, which again comes last. These results are in neither case in full accord with that obtained in 1891 and this fact, added to their dis-Punjab Census Report, 1892. Section 157.

agreement one with the

other, shows how impossible it is to base general conclusions on such a small number as 200,000. 7. Comparison with the vital statistical data.-It is necessary to

bear in mind two points in making any attempt to reconcile the Census return of ages and the birth and death-returns. The first is that the Census figures are for the whole of the population, while Paragraph 9, Chapter II, supra. the vital statistics are not. This is, how-

The second point is that, in the absence of ever, a comparatively small factor. any rule requiring either the current or the completed year of life to be uniformly Annual Form IV of the Sanitary Administration entered in the death-registers, we cannot be at all sure that the ages given in the

death-returns by age are correct or even consistent. If it be usual in these Provinces to state the current year of life in specifying a person's age many children dying at less than 5 years of age must be returned among those dying between 5 and 10. Hence the death-returns probably under-estimate the amount of the mortality amongst children and infants to a considerable extent.

According to the vital statistics 843,970 children were born in 1900, but in that year 246,577 children were returned as having died in the first year of life, leaving only 597,393 infants under one year surviving on the 1st January 1901. The number on March 1st, 1901, must have been slightly greater than this as births normally exceed deaths. But on the latter date no less than 732,080 children under one year were enumerated in the final Census, or

The silps taken were of the Rohtsk District.

These slips were taken from five representative Districts (Hissar, Rohtak, Hoshiarpur, Jbalum and Multan).—20,000 of each set from each District.

[†] The deaths of infants under 1 recorded in 1900 would include a certain number born in 1899, but the number would not be large, for the antenum of 1900 was the season of highest mortality and the greatest number of deaths occur in the first few weeks of life.

134,393 more than the number to be anticipated from the vital statistical returns, while if it be the case that children dying under 1 year of age would be returned as dying in the 1—5 years age-period the number of deaths amongst infants must have been more than the number returned, and the number of survivors pro tanto less, so that the discrepancy is in reality even greater than it appears.

If we turn to the figures for the second year of life we find an extraordinary Subridiary Table II, Column 2. discrepancy, for whereas 304 male infants under 1 are returned, in every 10,000

males, only 159 are returned between the ages of 1 and 2, a drop of 145. In 1881 the drop was 133. There seems then to be little or no doubt that, even in a matter so simple as the record of age in the first two years of life, we have failed to obtain accurate data.*

Again, when we turn to the age-period o and under 5 and compare the figures with those for the second lustrum, 5—10, we find that the former are less than the latter by nearly 160 000.

Vol. II, Table VII, page ii, columo 2.

less than the latter by nearly 160,000, although in a healthy population, in-

creasing at a normal rate, we should expect to find the population based, as it were, on a broad foundation, with more children under 5 than in any other quinquennium. But turning to the vital statistics we find that the births recorded during the five years 1896-1900 exceeded those recorded in 1891-1895 by 431,875, and that the mortality amongst children, though much heavier in the years 1896-1900 than in 1891-1895, was certainly not heavy enough in the former quinquenium to make the number of children under 5 less than the number between 5 and 10 surviving on March 1st, 1901.

The only conclusion which can possibly be drawn from the figures is that the Census data cannot for a moment be taken as absolutely, or even approximately, correct.

8. Comparison with the figures of 1881.—The relative accuracy of the data is however hardly open to question. We cannot maintain that the

Number of children in 10,000 of each sex. 1881. 1901. Ags. Females. Males, Females 332 313 351 304 180 110 177 202 2:8 277 200 230 288 250 201 253 297 205 277 374 1.257 1,374 1,220 1,375 Total o- 5 1,366 1,380 5-10 1,374 1.372 2,623 2,603 0-10 2,754 9,747

rule, to record the completed year of life, was more carefully acted upon in 1901 than in 1881, and, as far as is known, no change in the habits of thought of the people has occurred in the last twenty years which would affect the ages returned. Comparison with the 1881 figures then should be of value.

The decrease in the proportion of very young children, under 2, is very marked† in both sexes, but there is a great improvement after that age, and the proportion of children under 10 has risen slightly.

Cf. Subsidiary Table 11, columns 2-3, 6-7.

The decrease in the number of children under two years of age is not easy to explain. 1890 was a year of high birth-rate, 994,001 births, or nearly 150,000 above the average of the decade, having been recorded in that year. In 1890 and 1900 the infant deaths were more than 50,000 above the average, and probably as many more of the deaths between 1 and under 5 in 1900 were among

* But according to Newsholmes' Vital Statistics, page s, parents in England are equally vague.

† Perhaps the figures in the margin, which give the percentages of increase in the number of children of each age up to 5 since 1851, bring this fact out more clearly than does Subsidiary Table II.

children born in the preceding year. If any real confidence in the data could be felt one would be tempted to say that the increased proportion of children between two and three years of age is due to the enhanced birth-rate of 1899, though the children born in that year would have been barely two on March 1st, 1901, and that the reduced proportion of children under two is a result of the heavy mortality, which was subsequent to the period of enhanced birth-rate in 1899 and 1900. The increased proportion in the total 0-5 age-period would be satisfactory if it were certain that the increase was real. The decrease in the 5-10 age-period is possibly due to the heavy infant and child mortality of 1892, but the great increase in the number of births in 1894 and 1895 should have more than compensated for this. All that can be said is that a very large number of children aged 6, or even 7, have been returned as aged 5, a fact

Subsidiary Tables I, A and B.

already obvious from the an-

nual age returns, and that, taking the total number of children under 10, it is satisfactory to find that childlife is on the whole less precarious than it was 20 years ago, a conclusion supported by the increased number between 10 and 15.

 Mean Age.—Our calculation of mean age requires explanation on one point. Taking, as we do, in Subsidiary Tables II and III, A. our calculations, all the ages

returned as over 60 in the lump, and treating the 60-and-over period as equivalent to a 60-65 period we tacitly assume that no one lives beyond the latter age, though as a matter of fact the numbers returned as over 65 are considerable. The figures for the periods over 65 have, however, been worked out, and it has been found that they do not affect the figures given in the Subsidiary Tables which are only calculated for a single decimal. If we carried on the calculation to a second decimal the lumping together of all the ages returned as over 60 would affect the results.

The greatest caution is required in drawing any conclusions from the statistics of mean age. Thus, for example, a decreasing proportion of children may raise the mean age of the population, but the rise in the mean age would indicate no increase in its longevity. Again immigration, which rarely includes the very young or the very old, may raise the mean age of the population, or again famine may carry off the old and the very young and leave the main age of the population where it stood. Examination of the figures for those under 15

	19	01.	18	81.
_	Male.	Female.	Male.	Female.

Subsidiary Table II.

and those over 45 shows, however, that in these Provinces the proportions, both of the young and of the old, have increased, and this improvement is very noticeable in the ratio of the women over 45, which is now 1,530 among 10,000 females, as against 1,495 in

1881, and amongst males under 15, now 3,848 in 10,000 males as against 3,809 in 1881. The improvement is probably to a great extent a real one, for though emigration from among the adult population may account for the decreased proportion among the men between the ages of 15 and 35, it cannot be the cause of the decreased proportion of women of those ages, a decrease very marked in the 20-25 period.

10. Age-distribution by religions.

			PROPORTION IN EACH AGE PERIOD.										
		o-s.		5-15-		0-15.		45 and over.					
		Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.				
Hindus Sikhs Jains Mohammadans	=	1,151 1,145 1,148 1,358	1,260 1,153 1,247 1,480	2,530 2,443 2,386 2,668	2,450 2,230 2,380 2,500	3,692 3,588 3,534 4,026	3.719 3.383 3.627 3.980	1,595 1,665 1,620 1,548	1.553 2,852 1,605 1,468				

An examination of the age constitution of each religion by sexes gives some curious and not easily explained results. Taking young children under five years of age we find practically no difference among the males of the Hindu Sikh and Jain communities, while the proportion of female children to the females of all ages is conspicuously low among the Sikhs. Mohammadans on the contrary have a high proportion of children in both sexes. These ratios are continued into the 5—15 age-period. These results show that there is very little ground for holding that the Sikh population is extensively recruited by the conversion of adults to that religion, for the Jains have a smaller proportion of males under 15 than the Sikhs, and the latter are not far below the Hindus.

It must further be noted that the figures possibly minimise these differences, for the Sikhs probably furnished many more emigrants, in proportion to their numbers, to countries outside these Provinces than the Hindus or Mohammadans, though the latter now emigrate readily to Australia and East Africa.

The figures for the old are also striking. If we take the 60-and-over period we find, as in 1891, that the Sikhs and Mohammadans have a high proportion of old men, but that there are Punjab Census Report, 1892, paragraph 163.

among the Hindus than there are among the Mohammadans. The Sikhs show a high ratio of women of this age, obviously because they have a very low proportion of young girls, and this is the cause of the high figure for mean age amongst Sikh women.

II. Age distribution in certain Districts and tracts.-The excess of males over females in these Provinces renders it necessary to consider not only the distribution of 10,000 of each Sex, but the age-distribution of 10,000 of the population, including both sexes. For example if we take 10,000 of each sex we find 1,257 males to 1,374 females under 5, but by taking 10,000 of the population we find the numbers are 694 and 646 respectively, showing that male exceed the female children, although, proportionately, there are more children under 5 amongst the female population than there are amongst the male.

Subsidiary Table IV.

Taking the ages per 10,000 of the population (and not of 10,000 of each sex), in order

to compare the proportions of the sexes, the age-returns for certain Districts are of interest. In British Territory, in both Provinces, we find 1,340 children under 5 in

Children Females Children per 1,000 1. Hissar 9.9 957 884 929 s. Ambala 3. Karnal 1,140 4. Kai gra 5. Roh ac 6. Gurgaca 1,166 956 1,197 990 7. Gujra 8. Amritsar 9. Jhelun 1,350 1,310 942

every 10,000 of the population, but in Hissar we find the startlingly low proportion of 999 only. Rohtak also has the unsatisfactory proportion of 1,197 and Jhelum is below average. In these Districts there is good reason to believe that this deficiency of children is due to scarcity. Karnal also

has a low proportion, only 1,149 in 10,000, while the ratio in Kangra is signifi-cant of the tendency to remain stationary evinced by its population. Amritsar, despite its low ratio of female children, is above the Provincial average, and Gurgaon is close to it.

The District which claims most notice is Ambala, with 1,093 children under 5 (580 males and 513 females) in every 10,000 of its population, because famine does not explain its position. It is far worse than Karnal and Rohtak, though better than Hissar, and this fact is a further proof of the permanent character of the decline in its population.

Appendices to the Sanitary Administration Reports, Punjab :-

H. of 1890-2. E. of 1893. C. of 1894. D. of 1895. A. of 1896-9.

The figures for certain unhealthy villages in the Districts watered by the Western Jumna Canal do not go far to explain the figures in Ambala, Karnal, or Rohtak. Vital statistics for these villages will be found in appendices to the Sanitary Reports for the Province up to 1899, since when the return has been discontinued.

been discontinued. The figures for the proportion of children in these tracts are given in the margin. The population in each case is sufficiently large to justify the conclusion that these tracts, as a whole, remain unhealthy, the proportion of children being abnormally low, and in each case far below, not only the average of these

Provinces, but also that of the District in which the tract lies. The proportion of females in these tracts is also very low, and the numbers returned as aged 60 years and over are also few, in comparison with the Provincial figure. It must be borne further in mind that these are data for villages selected for observation and that they do not exhaust the list of villages which suffer from natural or artificial swampage in these Districts.

The figures for age-periods in the Kangra District are curious, and go

to prove the accuracy of the vital statistics which always show greater mortality among females than among males between the ages of 20 and 30. The result is that while between 20 and 30 the females slightly out-number the males, there is after 30 a very marked paucity of females of all the remain. ing ages. Again in the first 5 years of life the females exceed the males. From 5-20 the males out-number the females, probably partly because there is an objection to

returning the ages of girls at these ages: then between 20—30 there is an excess of females in compensation. But by the time the age of 30 has been reached the ratio of women has fallen, and thereafter it continues to fall rapidly. The figures illustrate the unhealthly overworked lives which the hill women lead, and more than explain why the Kangra population is stationary.

12. Age-distribution in the cities.—The data for ages in the cities throw much light on the constitution of the population in those areas.

Generally speaking male children are conspicuously few, except amongst the Jains, in Lahore and Amritsar. The explanation is that the Jain population is confined to the urban areas and so not recruited by immigration from outside, except in the case of Delhi, where the Jain community appears to be a foreign community largely recruited from Central India. The number of female children is, on the other hand, fairly large in proportion to the total number of females, and sometimes equal to, or even greater than, the average for the Provinces as a whole, the female population in the cities being mainly town-bred and not largely augmented by immigration.

This comparatively low proportion of the very young in cities is also found in the 5-15 age-period, after which there is a rise, and the city populations have proportionately far larger numbers between the ages of 15 and 45 than are found among the outside population: the Mohammadans of Delhi being a notable exception. These data thus add to the knowledge obtained from the immigration figures, which only show that the influx into the cities is largely composed of

males, while the age data show that the immigrant males are, probably, nearly all adults. The female element in the city population is much more stable, but is also increased to some extent by immigration. The net result is that the mean age in towns works out to a very high figure in almost every case, but that does not prove the greater longevity of the city populations. Further we can draw no conclusions from the paucity of children as to the relative fertility of the people in the cities and elsewhere, for, while we know the numbers gained by immigration we have no data for the numbers who emigrate from the cities. Nor can we tell from the proportion of the children in each religion whether, as would appear to be the case, city life has a worse effect on the reproductive power of the Hindu than it has on the Mohammadan population in the cities, because we do not know the religions of the immigrants. The figures certainly point to a lack of vitality generally in cities, and support the view that child-life in urban areas is exceedingly precarious owing to the inadequacy of the milk-supply. The distress among the Mohammadans in Delhi during the past few years does not, however, seem to have materially affected the population, for the proportion of Mohammadan children is higher there than in Lahore or Amritsar.

PART II.

SEX.

13. The determination of sex .- In a country where male issue is so ardently desired it is natural to find that attempts are made to predict the sex of a child before birth. "It is believed," writes the Reverend W. J. Wilkins, "that in Districts where infanticide is common amongst those who are not widows, as in Rajputana, and strenuous efforts are made to put a stop to it, astrologers profess to be able to say whether the child in utero is a male or female; if a female measures are resorted to Modern Hinduism, 1900, page 168.

procure abortion."

In the Punjab 'native midwives pretend to be able to tell with a great deal of certainty* whether a woman is pregnant with a boy or a girl, and they can either by means of instru-Major Paske's Report of 1867. Ludhiana. ments or medicines kill the

child in the womb or procure a miscarriage at any time, the death of the woman often ensuing.

The ratio however fluctuates from some inexplicable cause. It fell steadily from 1890 to 1895, rose in 1896, fell again from that year onwards, to 1899, and in 1500 rose again, standing in that year at 111: 100 exactly.*

Another point worth noting is that, in spite of the fact that the male birth-rate exceeds female, the female population tends to increase slightly faster than the male, so that if mortality of the two sexes were equal the number of females would, in time, approach the number of males.

15. The comparative mortality of the sexes.—This tendency of the

DEATH-RATES FOR THE SAME.

female to gradually be-come equal to the male population is however counteracted by the greater mortality amongst females, which is illustrated by the marginal figures. This mortality is accentuated during the unhealthy years. Thus in 1891, a year of very low mortality, the rates were almost equal, and in 1895, also a healthy year, only 3 per cent. more females died, in proportion to their numbers, than males; but in the exceptionally fatal year, 1900, the excess was 10

per cent. The excess varies in degree, but is always appreciable.

[&]quot;The ratio rises to 136'9 in Peshawar, and in the trans-indus Districts, generally, is high. (Punjab Sanitary Administration Report for 1896, § 6.)

16. Comparative mortality of the sexes at each age-period.—
The data given in the Punjab Sanitary Administration Reports are calculated on the ages of the population as given in the Census Tables, and thus the ratios

obtained since 1891 are subject to the considerations set forth in paragraph 156 of the Punjab Census Report, 1892. This explains the discrepancies between the ratios for 1890 and those for the ten succeeding years, but the relative value of the figures for 1891-1900 is not thereby affected.

As in England, males show a greater average mortality in the first year of literation than females, but it is important to note, as bearing upon the question whether female children are taken less care of than boys, that, in the years 1897 and 1900, the years of most severe scarcity in the past decade, the female infant death-rate exceeded the male, though in the unhealthy year 1892 the normal excess of infant male deaths is observed.

In the 1-5 age-period, however, there is a greater mortality, in nine years out of the past eleven, amongst females and this excessive mortality continues, almost without exception, until the close of the 30-40 age-period. After 40, males appear to have a far smaller expectation of life than females. This greater mortality amongst females, therefore, is not confined to the child-bearing ages, but commences shortly after infancy. It has, indeed, been very marked in the past few years, in the 1-5 age-period, especially in 1892, 1896, 1897, 1898 and 1990.

17. Seasonal death-rate amongst children.—The Subsidiary Table V. B embodies a return of considerable interest. The month usually most fatal to children under five years of age is October, but in 1890 August was conspicuously the month most unlavourable to child-life, and in 1896 the conditions were altogether abnormal, January having been by far the most fatal month to infants under one year, while May showed the highest mortality amongst male children over one but under five years of age, and September the highest amongst female children of that age. Thus it does not appear that female infant mortality is due to any seasonal influences and this fact is of special importance in the following connection. In 1892 Mr. Maclagan wrote:—

"It has been suggested to me that the methods of dressing young children (when they lear spantyo page ary of Pusjab Ceasus Re. are dressed at all) may have something to do with the different rates of death among girls and boys. In the centre of the Province it is customary to find young girls dressed in petticoats only, and young boys in jackets only; and as the latter is undoubtedly the sounder method from a sanitary point of view, the boys have a better assurance of life than the girls. It is not clear, however, whether this difference in the methods of clothing children is in any way confined to the central Districts, and even if it were, the figures which will be quoted in the following paragraphs point to other conclusions besides that above suggested. And it is reasonable to hold that the deficiency of infant girls in these Districts is due mainly to the greater neglect in these Districts of infant female-life. The Sanitary Returns prove this equally clearly, and the matter has been year after year the subject of infructuous comment in the Provincial Sanitary Reports."

If this suggestion were borne out by facts we should expect to find that girl children died in greater numbers than boys in the cold weather which is not the case, at least for the Provinces as a whole.

Certain Districts however are exceptions to this rule. Thus in Hoshiarpur the autumn months show a greater mortality among males under 5 than among females, but in the winter months the reverse is the case.

But in Juliundur the female child mortality exceeds the male in both seasons (though not in April—July.) Elsewhere, as far as my information goes, the mortality amongst male infants under 1 exceeds that among female children all the year round, and as very young children of either sex are alike hardly dressed at all, differences in clothing cannot be the cause of this excess of male mortality. After the first year there is a difference in the clothing, as described by Mr. Macq.

In forwarding this return the Sanitary Commissioner remarked: "It will be seen from the statement that the mortality does not run up in the cold months among girls. In the antumn months, where there is a general rise in the mortality in consequence of the prevalence of malarial fevers, the deaths among girls exceed those among boys, but the increase is sight."

lagan, but that fact does not explain why in Kangra the rate of mortality amongst male is greater than that amongst female children under 5 in both autumn and winter.

The general rule, however, holds good, and that is that, taking the Provinces as a whole, female children do not die in excessive numbers at any season of the year. Further the children of all religions are dressed much alike, in the same locality, so that excess of female child mortality in any religion could not be due to a different way of dressing girls of that religion. That local conditions or customs may affect the relative mortality of the young of each sex is doubtless quite possible, but I have no detailed information on the point and, if I had it, it would be out of place here.

18. Comparison with English data.—So far then there is nothing very remarkable about the vital statistics for the sexes. We find 111 male to 100 female births, as a gainst 105: 100 in England in

1838-47, but in certain countries the ratio was 108, 110 and even 118.8 to 100.

It is difficult in the extreme to compare the rates of infantile mortality in

Înfant mortality per mill	B LIVING.	
	Males.	Females.

Longstaffe's Studies in Vital Statistics, page 6.
 marked in these Provinces as in England.

England with those in these Provinces because of the uncertainty as to ages, but the marginal figures appear to show that infant mortativity is far greater than in England, which is precisely what might have been anticipated. Comparatively the excessive male mortality amongst infants under I year is not so

As soon however as the first year of life is passed the difference between our conditions and those in England is very striking, for there the mortality in both sexes is the same from the 3rd to the 3gth year of life, and after that females die less rapidly than males, whereas in these Provinces females die more rapidly, in proportion to their numbers, than males up to the age of 40.

throughout the world cannot indeed be accurately stated, since for a great part of it statistics are not available, or are too inaccurate, but it is perhaps possible to form some idea of the ratios, and, in the nature of things, most accurately in Europe,' This is Conrad's verdict, and nothing further can be expected until further statistical information is obtained. The excess of the female over the male element in the population

is thus almost confined to Western Europe. Italy, Greece, and the countries of South-Eastern Europe, including the South and East of Hungary and the country of the Don Cossacks, have an excess of males. Putting aside the United States as a new country in which males necessarily predominate, Nicaragua and Mexico have a surplusage of females, as have countries in which the red races form the mass of the population. Whether the causes of these divergences are climatic, social or racial is a problem yet unsolved.

20. The proportions of the sexes in these Provinces.—The number

Excess males			2,143,423
Excess males *** ***	***	***	
Deduct excess of male immigrants	***	***	28,735
Add excess of male emigrants in India		•••	2,114,688 50,480
Net excess of males	***	***	2,165,168

of males in these Provinces exceeds that of the females by 2,143,423, but the number of males who have immigrated into the Province exceeds the number of females by 28,735 and that number

must be deducted to give the true figure. On the other hand, the number of males who have emigrated must largely exceed the number of female emigrants: indeed, taking the emigrants in India (for which alone we have statistics), it is found that the males outnumber the females by 50,480, and these must be added to the number of males, so that we have an excess of upwards of 2,100,000 males to explain, or, in other words, we have to account for the low proportion of females in these Provinces, the ratio being now 852 females to 1,000 males, which is in accord with the figures of 1891, when it was 850 females to 1,000 males.

I may say at once that I believe the explanation of this remarkable disparity in the proportion of females is a consequence, more or less direct, of the social system of these Provinces, which will be described in Chapter VIII. In this chapter I shall discuss the actual figures for the sexes by locality, religion, and then by caste and tribe.

21. The proportions of the sexes in different parts of these Provinces.—The variations in the proportions of the sexes in each District and

For the general proportions of the sexes see also Subsidiary Table 1.

State are illustrated by the map opposite. In British

Territory, both Provinces, there are 855 females to 1,000 males, and in the Native States 836, but in the cis-Indus Districts (excluding Native States territory) the number rises to 858, as against 834 trans-Indus, and in each of these areas, except the last, the ratio has risen since 1891, which year showed again a higher ratio than 1881.

The variations in the different Districts or States are, however, considerable, but can in many cases be explained. The Simla District and Chenab Colony have very low ratios, but they are accounted for by immigration.

In the Punjab, the lowest ratios are in the Phulkian States and the Ambala District, and immigration of males does not account for this.

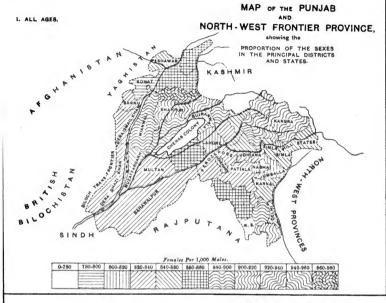

The Districts of the South-West and Centre are all low, Dera Ghazi Khan, Multan and Bahawalpur having between 820 and 84,0 females per 1,000 males, while in Muzaffargarh the number is only 842. Of the central Districts and States, Ludhiana has 823, Maler Kotla 849, Ferozepur 827 and Faridkot 802, the same figure as Nabha. North of the Sutlej, Amritsar has 829, or, excluding the city population, 846 females to 1,000 males, Lulhore, excluding its city population, has 842 females to 1,000 males, Jullundur, Gurdaspur and Gujranwala are all between 840 and 850, and Kapurthala only returns 851.

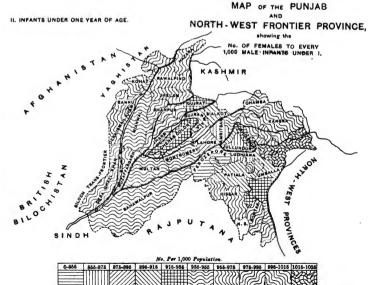

The Himalayan Districts show much better results, all except Nahan, Simla, and the Simla States being above 880, while Kangra and Chamba rise to over 920. Hoshiarpur, with 882, is contiguous to this area.

In the West and North-West of the Punjab, Jhelum with 979, the highest ratio in these Provinces, forms the apex, as it were, of a pyramid. The adjacent District of Gujrat has 927, while Sialkot falls to 891. Shahpur, also contiguous with Jhelum, has 919, while Jhang falls to 889, Montgomery still further to 862 and Mianwali to 895 females to 1,000 males. Rawalpindi, north of Jhelum, has 879 and Hazara, still further north, 869.

In the South-East of the Province the ratio falls as we go north. Gurgaon, hardly a Punjab District, save administratively, has 911 females to 1,000 males, Rohtak 893, Hissar 869, Delhi, excluding the city, 869 and Karnal falls as low as 844. It is worth noticing that in the petty States of Pataudi (905), Dujana (937) and Loharu (866) the ratios are much the same.

In the North-West Frontier Province the conditions are so different from those in the more settled territories of the Punjab that a high proportion of males

is to be expected, and all the Districts show a low ratio of females. Kohat has only 783 to every 1,000 males, being in somewhat marked contrast to Peshawar with 840. Bannu again with 828 is far above Kohat, but not as high as Dera Ismail Khan which returns 872.

The figures for the Punjab alone require discussion. The general improvement in the ratio of females returned to males has been attributed, in former Census Reports, to the more

women at each successive census, and the rapid rise in the figures for Jhelum and Rawalpindi seem to be only explicable on this supposition. But male emigration from Jhelum undoubtedly

with its large cantonments, is exceptional in character.

Again the improvement in the ratio is by no means uniform, and indeed certain tracts show a worse $\frac{N_{abh_1}}{N_{abh_1}}$ $\frac{1501}{823}$... $\frac{1581}{823}$
in the margin show lower ratios now than they did at the last census, but there is no reason whatsoever for supposing that the enumeration in Patiala, which shows an improved ratio, was more exhaustive than in Nabha. As Mr. Maelagan pointed out in the case of Hazara, in 1891, improved enumeration does not necessarily result in an increase in the proportion of females returned, and that this is the case is apparent from the fact that in Kangra the Mohammadans now return a higher proportion of males than in 1881, whereas Hindus show a better proportion of females. It can hardly be that while the Hindus were more carefully enumerated in that District in 1901 than in 1881, the converse was the case with the Mohammadans.

I should hesitate to say that the customs of the people change so much in a decade that a decreasing reluctance to return the number of females in a house has had any appreciable effect on the ratio in any District. The figures obtained for the proportions of the sexes must then, I think, be accepted as substantially correct, and they appear to show that in the Himalayan and sub-montane t areas women are fairly numerous. As to the plains it is difficult to state a general proposition more clearly than the map does. The naturally fertile Districts have, as a rule, a better ratio than the barren tracts, yet we find Amritsar and Jullundur lower than Hissar and Montgomery. We can, however, deduce no universal rule from the data. In the North-West Provinces and Oudh, it has been observed that the proportion of females increases from West to East, and roughly speaking a line from Gorakhpur to Allahabad may be drawn, east of which the females exceed the males, while the converse is the case to the West. This fact points to climate as the determining factor in the proportions of the sexes, but taking the Punjab figures by themselves it appears that there must be other factors to cause the local variations described above.

22. The proportions of the sexes by religion.—The figures for each religion are:—

	190		18	91,	
In British Territory	Hindus Sikhs Mohammadans	841	*** 1	,	841
In Native States	Hindus Sikhs Mohammadans	843 781 848	Mohammadans		778 871
In both Provinces		852			

^{*} The presumption appears to be that females are more exhaustively enumerated than males because they travel less. At the preliminary census females would be less likely to escape enumeration than males, not in their own homes, and at the final census the males, who form the mass of the travelling public, would be more liable to be under-estimated.

[†] One cannot say Sub-Himalyan, for Ambala and Gurdaspur in that area have a low proportion of females.

The first question which arises is whether the line between the Hindus and Sikhs has been accurately drawn. The point was discussed in the last Census Report and Mr. Maclagan thought it possible that the male baby in a

Punjab Census Report, 1892, § 171.

Sikh family may sometimes have been returned as a Sikh, while his little sister was entered as a Hindu: but this would account for a very small proportion of cases. I think this opinion was perfectly correct and it has been confirmed in this way.

Subsidiary Table VII-B.

In the seven Sikh Districts a note was made in the Census schedules of 2,000 families

in each District of the relationship of all the females in a Sikh household to its head. Thus in the house of a Sikh Jat it was noted against each female whether she was his wife, sister, etc., or a servant. These entries were then tabulated and it was found that only 3'4 per cent. of the women in Sikh households had

been returned as Hindus. The percentage varied in the different Districts, as the marginal figures show. At first sight this looks as if the Sikh figures for females should be increased by 3.4 per cent., and those for Hindu females diminished pro tanto, but this would I think be quite

incorrect. Our figures do not necessarily imply that Sikh females have been incorrectly returned as Hindus in this proportion. They merely state, what was known before, that there may be Hindu females in Sikh households. Whether per contra there are Sikh females in Hindu households is another question, but there is nothing to justify the assumption that the Sikh figures are wrong. Sikhs constantly marry Hindu women and when they do so, I was informed at the Golden Temple at Amritsar, the wife ought to take the pahul in order to become a Sikh, but it is not to be imagined for a moment that this rule is always observed, and it may well have happened that a good many Hindu women married to Sikhs have not become Sikhs and so have been, correctly enough, returned as Hindus.

This opinion is confirmed by the results of a special scrutiny of the pre-liminary record which was made in the seven Districts in question. In each District an officer was deputed to ascertain if all the female children in Sikh families had been entered,* and to note if their ages had been correctly recorded. I summarise their reports below :-

Ludhiana,-L. Sri Ram, Extra Assistant Commissioner, submitted a most useful report on his enquiries in this matter. He found that in five instances the wife of a Sikh had been on his enquiries in this matter. He found that in five instances the wife of a Sikh had been recorded as a Hidud, the reason in three cases being that she was addicted to the use of snuff. The unmarried girls had been invariably recorded as Sikhs, but a girl married to a Hindu was recorded as a Hindu, the idea being that a woman could not be of a different religion to ber husband. He also detected the omission of three Garewal Jat girls from the record, in as many different villages, but was of opinion that the omissions were not intentional. Ages he found to be in the main accurate, the discrepancies not being serious. It is to be noted that in this District, and in Feroepur, the number of females among the Sikhs (807 per 1,000) exceeds that among the Hindus (795 per 1,000).

Ferozepur,—Bhai Chart Singh, Extra Assistant Commissioner, made a careful inspection of the entries for over 2,000 Sikh families (chiefly Jats). He found that the women and girls were returned in these families as Sikhs, that the ages of children were usually correct and that girls were duly entered. He failed to detect any errors affecting the accuracy of the record in any material respect. It should be noted that in this District, as in Ludhiana, the Sikhs have a higher proportion of women than the Hindus (834 as against 775 per 1,000).

Lahore .- Out of 4,899 females in Sikh families in 14 villages none were returned as Hindus, all being shown as Sikhs, according to the tabulated entries.

Amritsar .- In this District, Lieutenant Bigg-Wither, I.S.C. (since appointed a Politi-Amritsar.—In this District, Lieutenaut Bigg-Wither, I.S.C. (since appointed a Politi-cal Assistant in the Foreign Department), made a thorough enquiry and drew up a useful report in the short time at his disposal. He found that ages were fairly correctly shown; that Sikh girls were always so returned (except in the case of the 'Sultani' Sikhs); that in no case was the wife of a Sikh absent on service returned as a Hindu and that all children appeared to have been returned, but that the chaukidars' registers rendered little assistance in this last point as women, as a rule, came to the village (i.e., to their parents' home) to be

Reports were not furnished from Labore, Juliundur or Gujranwala.

DIAGRAM

confined, and then left. Lieutenant Bigg-Wither, however, failed to find any omissions of children from the record, in spite of the fullest possible enquiry on the spot. As regards the Sultani Sikhs, who smoke, they were found on enquiry to have been recorded as Hindus.

Gurdaspur.—In Gurdaspur an exceedingly thorough inspection of the entries in the Census schedules was made by M. Lachmi Narain, Extra Assistant Commissioner, who found that all the female relatives of Sikhs had been recorded as Sikhs; that all children had been returned and that the ages of girl children had been recorded fairly accurately. Four thousand seven hundred and sixty-six families were checked, including 2,000 of Jat and Khatri Sikhs. The record in this District would appear to have been remarkably accurate. Amongst the errors and omissions detected none affected the relative accuracy of the Sikh return for the sexes.

Sialkot.—The Deputy Commissioner at my suggestion extended this enquiry to the District of Sialkot also, and a careful investigation was made by S. Moghal Khan, Extra Assistant Commissioner, who found that the ages of girl children had been fairly correctly recorded and that children had been omitted from the preliminary record in some few cases owing to carelessness on the part of the enumerators, but that males had been equally omitted with females.

It seems clear from these reports, which were made quite independently of one another, that the number of Sikh women erroneously returned as Hindus was infinitesimal.

23. The proportions of the sexes by religions in the Punjab Districts and States.—If the number of Sikh women returned as Hindus had been con-

siderable in any District or State, we should have found a corresponding

				FEMALES PER	1,000 MALES.
	District			Sikhs.	Hindus.
Gujrat		***		905	916

Ambala	***	***		714	802

increase in the number of Hindu women, but the figures do not show this. On the contrary, the ratios in the two religions not infrequently rise or fall together, as the instances in the margin show.

24. The proportions of the sexes by caste.—In an examination of the Subsidiary Table VII-E figures for the sexes in the principal castes, certain considerations must be kept in

view. In the first place, the Hindu castes are, broadly speaking, endogamous, as marriage outside the caste is not permitted. Thus the Khatris may be regarded as endogamous, the cases in which Arora women are taken in marriage by Khatri men being so few as not to materially affect our figures. Mohammadans, on the other hand, are by no means so strictly endogamous. The Hindus on conversion to Islam retained for a time, and many still retain in practice, most of the restrictions of Hinduism with regard to marriage, but races like the Pathan do not appear to have been so bound, and thus Pathans are found to have no prejudices whatsoever in favour of endogamy and recently some of them have even married Chinese women. Nevertheless, in spite of the greater liberty enjoyed by Mohammadans in this respect, marriage outside the caste' is exceptional. It is only considered respectable to marry within the caste or, if the custom of the caste permits it, within the family, and a man who cannot obtain a bride in his own kin loses status. As a rule then, the figures do not appreciably exaggerate the numbers of females in any of the main Mohammadan castes, considered separately.

25. The proportions of the sexes by tribe and section.—When how-Punjab Census Report, 1883, § 354.

ever we come to the smaller units, within the caste, we are confronted by a difficulty

which was discussed by Mr. Ibbetson, for in many cases it is clear that on marriage the wife enters the tribe or section of her husband, leaving that in which she was born. Consequently the figures for a tribe may include the women married into it, though born in a different tribe, and exclude those who have married out of it.

The primitive idea would appear to be that in marriage the wife must be formally adopted into her husband's gens, for otherwise she could not eat with him or his kin, for marriage does not always result in making the wife a member of her husband's kin, or even socially his equal. For example, to this day a Bhatheru Brahman of Kangra may take a Brahman wife of the cultivating (Halbaha) group, but he cannot eat food, even pakki, from her hands until she has borne him at least one child. Analogous to this is the custom of calling the wife 'mother of so-and-so' (her son), and it would seem that once the wife only entered the husband's kindred when she had become the mother of one of its nembers. Thus it is possible that originally the got kunada, or 'tribal trencher', which is a ceremonious meal eaten by the women of the family with the bride, and which admits her into their society, was a rite intended to admit the wife into her husband's kin, though it is now merely a social usage.

The got kunala appears to be prevalent, throughout these Provinces, among Hindus of good status, and it is also observed by some Mohammadan Rajputs in Karnal, though in some parts, e.g., in Multan, it is unknown, and in the low hills above Hoshiarpur it is preceded by a formal entry (andrera) of the bride into the husband's dwelling, but this does not seem to admit her into his got or kin. Whether, apart from the got kunala ceremony, the wife enters her husbands's tribe or got on marriage is a question to which no general answer can be given. Thus Mr. Maclagan informs me that in Multan all Hindus change the got, but in Montgomery it is said that the Hindu Arora wife invariably retains her paternal got. In Gujranwala the Jats do not change it, whatever their religion may be, but other tribes do so: while in Sialkot it is said that all castes change the wife's got by the ceremony of the gotrachar, the recital made by the nai of the bride and bridegroom's genealogies. It is clear that there is no rule and indeed in Rohtak it is said that the Jat tribes have different customs, so that our returns in this respect are useless. In no case then can the figures for the sexes in a tribe or section be relied upon, for I have heard the question, whether the got is changed or not, hotly disputed between two educated Khatris who could not agree as to the custom in their own caste.

Another usage requires notice. It is a custom, at least in Kangra and in Gurgaon, to call the wife by the name of her father's clan,* and, though this custom is not now inconsistent with her entry into the husband's kin, it appears to point to a time when marriage did not necessarily admit the wife into the tribe. This usage doubtless prevented any uniformity in the entries in the Census schedules, in the tracts where it prevails.

To this uncertainty there is possibly one local exception, for among the Jats and other castes in Karnal, who allow karewa, the general idea is that on marriage a woman retains her own got, for otherwise she could not marry again into her husdand's got; and this was the view taken by the Mohammadan Chauhan Rajputs who have begun to allow widow re-marriage, but the Mandhar Rajputs, who do not allow it, consider that the wife enters the husband's got. Thus the effect of admitting the wife into the kin of the husband is that she becomes the sister, by adoption, of his kinsmen and so cannot, if she becomes a widow, marry one of them.

26. The proportions of the sexes in certain castes.—Full data of the Subsidiary Table III of Chapter VIII.

proportions of the sexes in certain age-periods are given in Chapter VIII, but for the purposes of this discussion I have excerpted the figures for all ages and those for children under 5, separately, prefixing the total population of the principal religions in each caste or tribe for facility of reference, because the significance of the figures for the proportions of the sexes varies directly with the numbers in the caste.

It will be at once observed that only in a very few instances do the females
Subsidiary Table VII. E. of this Chapter (IV).
and these instances are usually afforded by
very small tribes. Emigration of males probably accounts for the excess of

[•] In Ambala it is not unusual to call the wife by the name of her parents' village, e.g., Chudialo, or 'her of Chudiala.'

females in almost every case where it is found. For example, the Chibhs (Mohammadans) and Dadwal (Hindus), both Rajput tribes, have an excess of females, but in these two tribes the men enlist extensively, and so many of the men must have been enumerated outside these Provinces. Indeed male emigration must, to a certain extent, have diminished the number of adult males in every caste, but to what extent it is impossible to say. Amongst the Jats, however, and especially amongst the Sikh Jats, emigration to outside these Provinces must have sensibly diminished the number of men, and thus the proportion of women is really lower than our figures indicate. Taking the figures as they stand we find almost always that the Mohammadans have more females of all ages than the Hindus, and the latter again more than the Sikhs. I know of no real explanation of these facts. Conversions of males to Sikhism or Islam do not account for it, for, if the Hindu population were constantly supplying male converts to the other two religions, we should expect to find a high ratio of females amongst Hindus, with a correspondingly low ratio of females among Mohammadans and Sikhs, but the Mohammadans have the highest ratio of any.

Taking the main castes and certain large tribes it will be found that those

with the lowest proportion of females are the Mazhabi Sikhs, the Sikh Jats, Khatris, Rajputs (who are few in number) and Aroras, all these having less than 800 females per 1,000 males. The Hindu Jats, Gujars, Khatris, Rajputs, Koris and Ahirs come next in order of demerit, with about 800 females per 1,000 males, the ratio also found among the Sikh Chuhras. Bhatias Mahtams.

With the above exceptions the ratio is well above 800 per mille, though Kori, Hindu Ahir, Hindu Khokhar, Moha Kaiath, Hindu Moghal, Mohan Sud, Hindu Kharral, Mohan Saini Hindu 826 25 202 127 111 830 ••• 832 ... 111 835 835 845 Saini, Hindu ... 106 847 ... few large castes have a higher ratio than 850 per mille, until we come to the Hindu Chuhras, Lobanas, Meghs and Mahtams, and the Mohammadan Chuhras, Lobanas, and Sayads. It is impossible to deduce any general rule from these figures, though speaking very generally we may say that the higher the among Hindus the lower the proportion of women in it. The Jats, however, cannot be regarded as a particularly high caste, yet they are conspicuously the worst, for the Mazhabi is exhypothesi a Sikh, and the number of males in

this caste may well have been increased by conversions to Sikhism. It would not

be profitable to discuss the figures for tribes within the caste for the reasons given in the preceding paragraph. I turn then to the data for children under 5.

27. The proportions of the sexes among children — Hitherto 1 have been discussing the proportion of females of all ages in the population of these Provinces. It remains to discuss the proportions of the sexes amongst children, and here our figures may be taken as accurately representing the number of children of both sexes in the tribe or section for, if we take children under five, no females will have been married and changed their got before that age. The figures then are free from any ambiguity and the conclusions should be trustworthy.

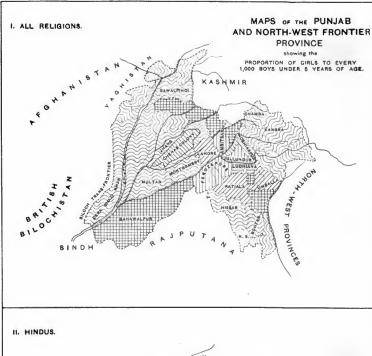

Taking first the main religions, we find that the Mohammadans have more female children than the population taken as a whole. The Hindus have less than the Mohammadans: the Sikhs have conspicuously few female children: while the Buddhists have many more girls than boys; and the Jains are on a level with the Hindus.

an in paragrapn 24 above. As the marginal figures show the ratio of females is higher among children than among females of all ages, except amongst the Sikhs in British Territory. Speaking generally, there is a noticeable tendency for the ratio to decrease as the age increases, which accords with the mortality data (vide paragraph 3 supra). When we come to consider the

figures for the 18 Districts and States which contain a strong Sikh element, it is found that (1) Mohammadans always have more female infants under 1 than Hindus or Sikhs, except in Amritsar and Gujrat, but that in Hissar, Ambala, Patiala, Jullundur, Ferozepur, Gurdaspur, Sialkot, Gujranwala and Gujrat they have fewer male infants in every 10,000 of the population: (ii) that in the 0—5 age-period the Mohammadans still have more females, except in Faridkot and Gujrat, but they have fewer males in Hissar, Ambala, Ferozepur, Sialkot, Gujrat, Patiala and Nabha and (iii) that, on the other hand, in the 5—10 age-period Mohammadans have generally fewer males than Hindus or Sikhs, but generally far more females. The inference is that, generally speaking, less care is taken of girl children among Hindus, and still less among Sikhs, than among Mohammadans, but there are local exceptions which it is all but impossible to explain. The paucity of male children among the Mohammadans in Ambala, Ferozepur, Faridkot, Patiala and Nabha is marked in the ages 0—10, and points possibly to a depressed condition of the Mohammadan population in those tracts. A still more puzzling feature of the return is the falling off in the proportion of Mohammadan boys between 5 and 10, which is inexplicable.

28. The proportion of females under 5 in each District by religion.—To simplify matters it will be best to consider only the proportions of the sexes among children under 5 years of age, on the total population and for the three main religions, as illustrated by the four maps which precede this page.

tricts. On the outskirts of the Provinces, where the Sikh population is small they usually show an extremely low ratio, but in Muzaffargarh and Dera Ghazi Khan they have actually more female than male children. In most of the main Sikh Districts the children are less than 80 per cent. of the male, and in all the other Sikh Districts between 80 and 90 der cent. Only in Delhi, Simla, Shahpur, Peshawar, Dera Ismail Khan and the

male children under 5 in most, but not in all, Dis-

IV. Mohammadans.—
In only two tracts is the ratio of female children less than 90 per cent., viz., in the Simla States and Ludhiana; and in only four others does it fail to be well over that figure.

The variations in the figures for Districts call for brief mention. The proportion of females to males under 5 ranges from 820 in Ludhiana to 1,072 per mille in Suket: amongst Hindus it ranges from 814 in Ludhiana to 1,073 in Loharu: amongst Mohammadans from 882 in the Simla States to 1,114 in Nahan: while among the Sikhs we find the wide range of from 333 in Rohtak and Gurgaon to 1,444 in Delhi. I can suggest no plausible explanation of these vagaries in the figures.

The only general conclusion to be drawn from the figures appears to be that the proportions of the sexes among children is not altogether a question of religion, for in spite of the remarkable and almost universal paucity of girls under 5 among the Sikhs it will be observed that, generally speaking, the Districts which show a low proportion of female children have a low proportion in each religion. Instances of this rule are afforded by Ludhiana, Jullundur, and Ferozepur.

29. The proportion of female infants under I.—I do not propose to discuss

these figures at any length. There is too much uncertainty about the accuracy of the figures for the first year of life to base any farreaching conclusions upon the data, although we have no reason to suppose that the ages of girl infants were less accurately recorded than those of boys. For all religions the order of demerit is that given in the margin. It will be observed that the ratios are

nearly always much better than those obtained for the 0—5 age-period, Ludhiana returning 856 per mille as against 820 per mille 0—5. Even Ferozepur, the worst District, returns 854, which is not nearly as bad as the ratio returned for the 0—5 period by Ludhiana. Only four important Districts fall much below 90 per cent.

the Hindus are given in the margin in order of demerit. Ferozepur is here conspicuously the worst, but Jullundur, Amritsar, Ludhiana, and Gujranwala are the only important Districts which show a really low ratio. Amongst the Sikhs Amritsar is very bad indeed, as are six other important Districts with a ratio of less than 80 per cent. The Mohammadans in-

variably show better ratios. In the petty States of Dujana, Loharu, Pataudi, in the Simla District, in Ludhiana and in Jind alone does the ratio fall below 90 per cent. and in Ludhiana it

is 898 fer mille, a veryfair ratio.

All religions

Hindus

I am at a loss for any real explanation of these figures. Granted that our age-returns are inaccurate, there is no reason whatever for thinking that the ages of girl infants under 1 have been exaggerated and that there are really more girls under than our figures show. The considerations which affect the age-data would, in the case of infants, affect both sexes equally, so that the relative value of the figures must be the same. Consider the figures for Gujrat and Gujranwala. Here we have two adjacent Districts, similar in climate, in race, and, as far

Gujrat. Gujranwala, All religi Hindus 800 878 772 927 936 Mohammadans

•••

as I am aware, with the same social system, yet we find an extraordinary difference in the proportions of the sexes among Hindus and Sikhs, though the Mohammadan ratio is nearly the same in both

and there is not very much difference in the ratios for the total population of all These facts defy explanation. Or we may take the contiguous

Districts of Ludhiana and Ferozepur, where we find that the total population gives almost exactly the same ratio, and that the Ludhiana Hindus show a better ratio than those

of Ferozepur, while in

Ludhiana the Sikhs and Mohammadans have a worse ratio than those of Ferozepur. This is contrary to all expectation for the Ferozepur Sikh Jats of certain tribes have been suspected of female infanticide on a extensive scale.

Fetozepur.

30. The proportions of the sexes among children in certain castes -In the case of children under 5 it is highly improbable that emigration affects the figures, and so we may assume their accuracy. Here again we find, almost without exception, that Sikhs have by far fewer female children than Hindus, and the latter again far fewer than Mohammadans. The Jats, as a body, furnish an excellent example of this, for while Sikh Jats have only 694 girls to every 1,000 boys, under 5, Hindus have 839, and Mohammadans 940: yet the Sikh Khatris have 931, and the Hindu Khatris only 914.

Taking the most important individual castes, in the order given in Subsidiary Table VII. E. the following remarks may be offered :-

The Ahirs .- Tribal hypergamy is said not to exist. Some families avoid widow re-marriage and so presumably stand high, while one got, or section, the Aphiria, is looked up to. The result of this general absence of hypergamy is that the Hindu Ahirs show the very fair ratio of 964 girls per 1,000 boys under 5.

The Aroras.—We find the Aroras, as a caste, fairly well off for women, the Hindus having 848 females per 1,000 males, and the Sikhs 790. This is what we should expect, for the Aroras stand lower than the Khatris in status and have but a faint imitation of their hypergamous system. They are, however, much given to purchasing wives, and these women have doubtless been, for the most part, returned as Aroras. The Hindu Aroras have a very fair ratio of girls (967 per 1,000 boys): but the Sikhs only return 886 per 1,000. In the South-West Aroras doubtless neglect their girl children, but taking the caste as a whole the figures are not unsatisfactory.

The Bhatias.—We should expect the Bhatias, as an immigrant foreign caste to show fewer women than the Aroras, but as their average wealth is far higher, we find that the Bhatias return more women than the Aroras. They have, however, a slightly lower proportion of girl children, but the numbers are too small for any conclusion to be drawn.

The Biloch.—As the Biloches are Mohammadans we should expect to find a good proportion of girl children among them and we are not disappointed, for the ratio is 949 per 1,000 boys for the whole race.

The Chuhras.—It is just conceivable that the Chuhra may, locally, be tempted to commit female infanticide, but it is in the highest degree improbable, yet we find the Mohammadan Chuhras with only 923, the Hindus with 917 and the Sikhs with 827 girls per 1,000 boys. These figures should be borne in mind when discussing those for the lats.

The Gujars and Jats.—We now come to the two castes whose sex-proportions are an unsolved problem. As far as we know, there is no tribal hypergamy in either of these castes. The Mohammadan Gujars of Gujrat have no doubt a social system which might lead to female infanticide, but the Mohammadan Gujars in these Provinces show 940 girls per 1,000 boys. On the other hand, the Hindu Gujars only show 868. The Sikh figures in this caste are too small for any inferences.

The Jat figures may be contrasted with those of the Rajputs on the one hand and those of the Mahtams and Lobanas on the other.

Here we have utterly inexplicable variations. The Hindu Jats show a very low

GIRLS PER 1,000 BOYS UNDER 5.

	Caste.		Hindus.	Sikhs.	Mohamma- dans.
Jat			830	604	940
Rajput Lobana		***	869 898	694 869 800	951
Mahtam	**		1,001	950	849

ratio, but the Mohammadan Mahtams are almost as bad. The Jat Sikhs afford data which find no parallel in any other caste, for even the Sikh Khatris have 766 girls per 1,000 boys under 5, as compared with 694, the Sikh Jat figure. It would be useless to attempt to

discuss all the Jat tribes. It is sufficient here to say that all the tribes of repute show a very low ratio of girl children, whether the Hindu or the Sikh figures be taken. The Sikh figures are in most tribes worse than those for Hindus, but there are many exceptions, as the figures in the margin show.

GIRLS PER 1,000 BOYS UNDER 5.

Ja	t tribe	1	Hindus.	Sikhs,	Mohamma- dans.
Dhariwal			673	773	714
Dhillon	***	***	822	631	850
Garewal	***		727	524	1,081
Gil	***	***	540	691	948
Man	***	***	812	719	948 879
Randhawa	***	*** 1	757	753	969
Sidhu	***	***	554	707	962
Sindhu	***	***	842	574	884
Virk	***	***	769	618	897

These variations do not follow the dominant religion in the tribe, because the Dhariwal, Gil and Sidhu are mainly Sikhs, yet in these tribes the Hindus show the lowest proportion of girls: while in the Dhillon, Garewal, Man, Randhawa, Sidhu and Sindhu Sikhism has most adherents and the Sikhs show a lower ratio than the Hindus.

These low proportions of girl children again are not confined to Sikhs and

Tribe.		Hindu.	Sikh.	Mohamma- dan,	
Ghumman			812	772	772
Hinjra	***		793	714	788
Chima	***		774	655	795

Hindus, for instances are given in the margin of tribes with a strong Mohammadan element which has as low a ratio of girls as the Hindus or even the Sikh part of the tribe.

In conclusion I may point out one fact of importance. We have found that,

	Hindu.	Sikh.	Mohamma- dan,
Jats	839	694	540
"Other " Jats	854	715	960

the Sikhs and the Hindu Jats, as a whole, have a low ratio of girl children, and that many of their tribes have exceedingly low ratios. But if we eliminate all those tribes and take the figures for other Jats, we find that much

Jats, we find that much of any pre-eminence, and so "Other" Jats do not include, I think, every tribe of any pre-eminence, and so "Other" Jats do not include any tribes of importance, social or otherwise, yet in this, the lower stratum of the Jat caste or race, we find nearly the same paucity of fenale children under 5, as we do among the higher tribes.

The Khatris.—In dealing with the Khatris we are at a disadvantage because the figures are usually small.

		Khatri sec	Hindu.	Sikh		
Bedi					883	668
Kakkar	***	***	***		851	***
Kapur	***	***	***	- I	839	686

Malhotra	1	***	***	***	876	1,029
Seth	***	***	***		870	900
Others	***	***	***		926	952

Thus the Bedis come out badly, but the whole of this section only numbers some 5,000 souls, of whom nearly half are Hindus. The Sikhs among the Kapurs, Khannas and Seth Malhotras are too few for any conclusions to be drawn, but it is noticeable that as far as they go

they are better than those for the Hindus, which is indeed usually the case among the Sikh Khatris as a body. All that can be said is that the Hindu Khatris only come out fairly well, and that in the highest sections we find a proportion of female children which is distinctly below the average of the caste, 914 (for Hindus).

Under 3,000 souls, all told.

The Rajputs .- The Rajput tribes are ill-defined units and our figures, especially for the Hindu tribes, are probably inaccurate. Many tribes too return such small numbers that nothing certain can be deduced from them. The figures of most interest are given in the margin and show the general low ratio of children in the Hindu tribes or in the Hindu element in each tribe.

31. The causes of the paucity of females.—The foregoing paragraph will, I imagine, have shown that, though the paucity of females of all ages is very marked in these Provinces, we are as far as ever from being able to assign it to any one definite cause. Indeed it appears impossible to draw any but the most general conclusions from the figures for the sexes in the returns of this and of previous censuses. Hitherto we have been considering figures for large areas, for religions and for castes containing considerable numbers, yet from these data, which allow full scope to the law of great numbers, no universal rules can be deduced. If smaller units were taken the more interesting, as Mr. Maclagan

justly observed, would the results be, but Punjab Census Report, 1892, § 171. at the same time the narrower the field the less trustworthy must our conclusions become. The utmost therefore that can be done in a general report of this kind is to indicate the most probable general conclusions, and any such conclusion must of necessity remain more or less a matter of personal opinion. That the causes of the low proportion of females in these Provinces are in the main social is, I think, fairly certain. If they were climatic our data for seasonal birth-rate would surely show some traces of the influence of climate. If they were economic we should certainly find that the lower and poorer castes had invariably a lower ratio of females than the higher, but the converse is generally the case. The social system of these Provinces will be dealt with, as far as our imperfect information allows, in Chapter VIII, in describing the organization of the different castes, but I may anticipate to some extent by saying that the law of hypergamy undoubtedly accounts, in some degree, for the paucity of females. That law compels a man to marry his daughter in a group of higher, or at least of equal, social status to his own, and thus narrows the circle of possible matrimonial alliances. But hypergamy is not the only law which has this effect. For example, there is the very important law which forbids the taking to wife of the daughter of a sacred group, or conceivably of a sacred village. It is not merely that a Sayad could not give his daughter in marriage to a layman, but that a layman would deem it sacrilege to contract such an alliance, even if the Sayad were willing that it should take place. This feeling that certain groups are sacred is common to all the great religions and is deeply-rooted, so much so that it appears to have been extended so as to forbid the taking to wife of a girl born in a village which has become sanctified by the birth of a holy personage within it. At least this is the only supposition on which the facts in certain cases seem to be explicable, but whether this conjecture is correct, or, if so, to what extent the prejudice prevails I am unable This much is, however, clear that the restrictions on marriage are to a great extent religious and not merely social.

It cannot, however, be maintained for a moment that hypergamy, and the objection to taking a wife from a sacred group, are the sole causes which lead to the great deficiency of females in these Provinces. Of this the Jats furnish an excellent illustration, for, if we assume that the higher groups of the Jats are hypergamous and that they therefore practise infanticide, we are still confronted with the fact that the lower tribes have just as bad a ratio of female children as the higher. But we know that the Jats of the lower stratum have no objection to selling daughters, and indeed marriage by sale, or at least exchange, is exceedingly common amongst them. This ought to result in a good proportion of girl children being found among the mass of the Jats, but the proportion returned is very far from satisfactory. It is therefore, I think, clear that there are other causes at work, but what those causes are is a matter of mere conjecture.

Again we may regard the question from another aspect and discuss the data for the Sikhs, considered as a religious body distinct from the Hindus. The Sikhs no doubt come out badly as a whole, as they did in 1881 and again in 1891, and it is impossible to give any plausible explanation of the figures. The Sikh doctrine of equality should operate against hypergamy, and doubtless it does so to a great extent, though it has not succeeded in abolishing that social rule. Moreover female infanticide is strongly condemned in the Granth as the greatest of the four deadly sins, and Sikhism has

Trampo's Adi-Granth, page 97.

Of the four oeasily sins, and Sikhism has undoubtedly raised, not lowered, the position of women. It would in truth be safer to say that female infanticide, if it exists, is practised by Sikhs in direct contravention of their religion, for everything in Sikhism leads, or ought to lead, to its absolute avoidance.

Vaguely we may say that in a rude, half civilized society, the weaker sex will go to the wall, and probably the general conditions of existence in these Provinces are as a whole inimical to female life, but this does not explain why the Sikhs should have a lower ratio of females than the Hindus, and the Mohammadans a higher ratio than either. Alike among Mohammadans, Hindus and Sikhs there are no rejoicings on the birth of a girl. On the Frontier women can hardly be said to occupy a high position for a wife has nearly always to be purchased, though occasionally a downy is given with the bride and she is not sold. Yet the Frontier Districts have a very fair proportion of women and compare favourably with the central Districts of the Punjab. All that can be said is that various causes, religious, social and economic, combine to render female life more precarious than male, and these operate with greater force in some sections of the community than in others. That the Mohammadan social system with its disregard of many artificial restrictions on intermarriage is favourable to female life seems almost certain, while amongst the Hindus the social organization of the higher castes undoubtedly accentuates the depreciation of women and female children which is common to all the communities. The Sikhs remain an unsolved puzzle, though it is clear that the causes of their small proportion of females are not to be sought in their religious dogmas.

There remains the crucial question whether infanticide is practised, and, if so, in what manner and to what extent, but infanticide is a wide term and its meanings must first be defined. I shall then discuss briefly certain forms and possible causes of infanticide.

- 32. The degrees of infanticide.—Infanticide, properly speaking, is the deliberate murder of a child at its birth, but there are other forms of the practice which consist in permitting a child to die, without any direct act towards that end. The degrees of guilt in these forms vary enormously. There may be the fullest intention to cause death, or only a half-conscious hope that the child may not live, but it is impossible to draw any hard and fast line of distinction between these degrees and all may be included in the term infanticide in the second degree.
- 33. Infanticide.—Infanticide is not a new custom, nor is the practice confined to India. It would appear that savage races take to the crime in order to escape the irksome duties of parentage, or are driven to it by actual want. Thus amongst the most backward races, suckling is continued for, it may be, several years, and a child is killed, immediately on birth, if the mother is, or thinks she is, unable to rear it owing to there being a young child whom she is still feeding.* The sex of the child seems immaterial. The Spartans exposed weakly children in the Apothetz and the Greeks (with the exception of the Thebans) did not forbid infanticide, which was common, specially in the case of female children. It was 'probably not uncommon,' in the earlier ages of the State—in Rome.

Female has thus always been more common than male infanticide, but there is a form of the latter still practised in these Provinces, and apparently throughout Northern India, which may throw some light on the causes of female infanticide.

34. Male infanticide.—The killing of a male child is, in the Punjab, believed to be a certain remedy for barrenness and is, as the Police records show, not infrequently perpetrated by a woman who has no children, or on her behalf. Various accounts of the ceremonies to be performed, in order to achieve the purpose of the murder, are given, but it is usually alleged that the woman who desires a child should bathe over the child's body or in water in which it has been washed. And according to one account the life should be taken with a bronze knile, and as much pain as possible caused, to make the remedy

efficacious. The use of bronze points to the idea of sacrifice as underlying the custom, but possibly the fundamental idea is that the life or soul of the murdered child may be transferred to the woman, as the bathing rite would seem

There is a curious point to notice in this connection, and that is the necessity for killing a male child. In the reported cases there is only one in which a girl was the victim and in that the parties concerned were Mohammadan fagirs. Nevertheless, it appears to be certain that there is a prevalent superstition that the murder of a child of either sex may, by certain rites, lead to the transmigration of its life to another human being.

This belief in the metempsychosis also finds expression in the following form of divination :-

Hindu women, when they lose a female child during infancy, or while it sucks milk, take the baby into the jungle and put it in a sitting position under a tree. Gur (sugar) is put into its mouth, and a batti, or corded roll of cotton, between its fingers. Then the mother says in Panjabi:-

Gur kháen, púní katte;

Eat the gur, spin the cotton;

Ap na áen, birá nún ghalle. Don't come back, but send a brother.

The following day they return to the place. If the dogs or jackals have dragged the body towards the mother's home, she considers it a bad omen, saying: "Ah! she is coming back—that means another girl." But if it is dragged away from the home, she is glad, saying: "The brother will come."

This can only mean that the return of the child's life was expected.

A somewhat similar idea underlies a case, described by Lieutenant-Colonel Temple, C.I.E., in 1884, in which a dead child was buried by its parents under the threshold "in order that in constantly stepping over it they might run no risk of losing any subsequent children that might be born.; They said it was the custom of the caste (Jaiswara) so to bury all children that died within 15 days after birth." That is to say, the life is kept in the house and not allowed to leave it lest it should not return.

On this theory the practice, alluded to in Sir H. Edwardes' report of 1852,6 of burying the female children, when killed, under the door, becomes perfectly intelligible. The belief was that subsequent children (sons it was hoped) would be born in their place, and this is possibly the explanation of the custom of burying, instead of burning, young children amongst the Hindus.

The tribes of Central Australia believe" that the spirit part of the child goes back at once to the particular spot whence it came and can be born again at some subsequent time even of the same woman."

35. Unlucky children.-There are various ideas and superstitions which led, possibly in former times, to the sacrifice of children, or to their exposure, and a survival of these usages is probably still to be found in the custom of giving male children to fagirs. It is also within the bounds of possibility that superstition is even yet strong enough to cause infanticide in a few cases.

. But the victim was not necessarily a very young child as the following verse shows :-

Mátá pitá dhanki lobhí :

Rais kat kadarof :

Devodevta bal ka lobhí, Ars kis ke pås pugární.

My father and mother are greedy of wealth, The king regards himself alone: The gods are greedy for a scarifics, To whom shall I make my plaint.

(A certain king had no soo and was advised to make a human sacrifice to obtain one. A man and a woman ware found who were willing to give up for the purpose their deal and dumb son, who, as he was led to the sacrifice, found voice, and gave utterance to the above.)

(The above is a saying current in Outer Saraj. The number of words of pure Sanskrit origin is notaworthy. A H. Diack, Kulu Dialect of Hindi, Lahora, 1896, p. 44.) + See Panjab Notes and Queries, Volume I, paragraph 450. The writer is Mrs. F. A. Steele. I have raceived confirmation of this.

Punjab Notes and Querias, Volume I, paragraph 925. Pessibiy the idea is that a subsequent child will be

cf. Tylor, Primitiva Culture, II. p. 5. North American Indians of the Algonquin districts, when the children died, would bury them by the wayside that their souls might enter into mothers passing by, and so be born again. § Page 403 of Selections, Punjab, Old Series, No XVI. The practice is said to have prevailed about Sirbali (in the Manjab) at the time of Renjit Siegh's first conquest of that tract.

1 Native Tribes of Central Australia, Spencer and Gillen, 1899, page 264.

A child (unlike a calf) born in Bhadon is lucky, while one born in Katak is inauspicious, and the mother of such a child should be turned out of the house, though she may be given to a Brahmin and then redeemed from him. Children born under certain asterisms are peculiarly liable, not only to misfortune themselves, but to cause evil to others, and various rites are performed to avert the consequences of their birth.

The innumerable beliefs regarding auspicious and ill-omened births depend mostly on astrology, which must still be a very powerful factor in popular religion. It is, however, exceedingly difficult to reduce these beliefs to rule. In the first place there is the primitive confusion of thought which makes no distinction between that which is holy and that which is accursed, so that a child born under certain conditions may bring grievous misfortune or the greatest happiness, but the chances appear to be that misfortune will ensue.

Very important also is the order in which the children in a family are born. Thus the first-born son of a wife is peculiarly uncanny, subject to magical influences, and invested with supernatural powers. On the one hand his hair is useful in witchcraft, and on the other its possession gives a wizard power over him, so that he must not leave the house on the night of the Diwali. Snakes become torpid in his presence, and he can stop hail by throwing a stone backwards from him, or by cutting a hail stone with a knife. He (or she) should not be married in Jeth, nor should the mother eat first-fruits in that month.

The position of the first-born is probably due to the fact that, if a son, his father is born again in him, so that the father is supposed to die at his birth, and in certain Khatri sections, e.g., the Kochhar, his funeral rites are actually performed—in the fifth month of the mother's pregnancy. Probably herein lies an explanation of the dev-kdj, or divine nuptials, a ceremony which consists in a formal remarriage of the parents after the birth of their first son. The wife leaves her husband's house, and goes, not to her parents' house, but to the house of a relative, whence she is brought back like a bride. This custom prevails among the Khanna, Kapur, Malhotra, Kakar and Chopra, the highest sections of the Khatris. These ideas are an almost logical outcome of the doctrine of the metempsychosis, and it as inevitably results that if the first-born be a girl, she is peculiarly ill-omened, so that among the Khatris of Multan she is used to be put to death. And so too it is said of the Peshawar District that it is considered a misfortune, almost a disgrace, for a woman to bear a daughter, especially if it is a first child.

In the south-west of the Punjab, among a Hindu population which has preserved some ideas of great antiquity, the third conception or trikhal is peculiarly unlucky and every effort is made to cause abortion; but elsewhere the term trikhal [or t(r)elar, tretar, or $cholar^{\bullet}$] is applied to a child of one sex born after three of the other, and, as a rule, such a child is specially unlucky, but not always, for the Khatris and Aroras of Attock consider it an auspicious birth, and in some places a girl born after three boys is even called bukhal or 'lucky.' Of three successive male children the second is fortunate; while of three girls the second is ill-starred; and so to a boy following and preceding a girl is inauspicious, while in the converse case the girl is fortunate.

The eighth child is dangerous to the mother, or, if a son, to the father, according to different local accounts. Apparently this belief is based on an analogy, birth in the eighth month of pregnancy being so often fatal.

Thus superstition to some extent familiarizes the people with the practices of abortion and infanticide. Folk-lore does the same, as in the story of Legesds of the Punjab, Raja Rasalo, Volume 1, Raja Sarkap who summarily directed page 50.

(he was losing his head at chaupur, the game forbidden to the Sikhs), to be executed. We must bear in mind that, assuming it to be the case that superstition still brands some children as unlucky from birth, males can be handed over

[•] In Kangra a cholor is so propitious that he (or she) is given away to a Barar or a Chuhra, and taken back again — apparently to avert any jealousy of his good fortune.

to the religious orders, which are not open to females, save in the case of the Buddhists.

36. Does infanticide prevail ?-That cases of infanticide occur is, I am afraid, a certainty. The idea is too familiar and the tradition regarding it are too numerous to permit of much doubt upon the point. Various tribes such as the Bedi Khatris, the Sidhu-Barar Jats, and Indian Infanticide, Cave Brown, 1857. page 3, Nos. 116, 133.

the Kharrals have variants of the stock legend that once upon a time a daughter

of the tribe was given in marriage to an inferior, as in the case of the daughter of the Raja of Nabha, in consequence of a trick, or that some slight was put upon the family of the girl, or that disgrace ensued through her abduction. Such legends are not confined to Hindu peoples or to India, and they show that at one time deliberate infanticide may have been regularly practised in the case of girl children. But it is very probable that the legend would survive the practise, the story being told as a proof of exalted social status in the past, like a claim to Rajput origin, when female infanticide had long ceased to be at all customary, so that these legends prove nothing as to present practice.

On the whole, I should be inclined to think that deliberate female infanticide is rare, and that when perpetrated it is due to a combination of causes. If it was felt that the child was likely to cause misfortune, and that her marriage would be difficult, it may be that she would be killed. But such cases cannot be numerous. To this the Jats, Hindu and Sikh, are a possible exception, and the only solution of the problem which in their case is that infanticide is a barbarous form of Malthusian practices. This idea was suggested many years ago by Major Goldney as Deputy Commissioner of Ludhiana, the District in which the data are the most inexplicable. Even less easy is it to account for the mortality amongst girl children after the age of infancy. No one who has seen the peasantry, especially the Jat peasantry, in their villages, at fairs and the like, could for a moment suggest that women and girls in this Province are treated, generally, with cruelty or intentional neglect. Sikhs, especially, treat women well. One can only say that ignorance and an uncenscious ill-treatment of females at all ages may result from the low estima-

37. Traffic in Women .- The disparity in the numbers of the sexes leads, beyond all doubt, to one evil on which a few notes may be of interest. There exists within these Provinces a traffic in women which is carried on by what has been described as a kind of disreputable matrimonial agency, and Punjabi women are also exported to Sindh, in which Province the paucity of females is very marked, according to the returns of 1891.

tion in which savage and backward races hold women. Of all the data obtained the most significant is the mortality among female infants in years of famine.

In the Punjab the traffic is assigned to the scarcity of women, to the difficulty and expense attendant on the regular negotiations required for obtaining a wife within the caste, especially if the first wife has died, and to the restrictions imposed by Hindu custom on marriage within certain gots. The purchasers of women are mainly Jats (both Sikh and Hindu), Aroras or Kirars, and, in a less degree, Kambohs and Khatris. As regards the Kirars of the Thal, Captain Crosthwaite significantly says:—'The ordinary Kirar family has few children and female children are treated with culpable neglect.' The traffic has many ramifications, but the main sources of supply appear to be the Himalayan and sub-montane Districts, whose women are well favoured, of somewhat easy virtue, and incredibly ignorant. Women are also imported from the east of the Jumna. It is interesting to observe, as bearing on the question, how far the Punjab castes are endogamous, that the women so purchased are not infrequently married, either by the regular ceremonies, or by the karewa rite, and though a wife so married is looked down upon by her regularly betrothed and married neighbours, there is, as a rule, no dispute as to the legality of the relationship. A faint pretence is kept up that the girl is of the purchaser's caste, but he usually allows himself to be very easily deceived, and thus women of the lowest castes or Mohammadans are frequently sold and become the wives of Hindu Jats or Aroras. It is worthy of note that Mohammadans in the Punjab Province are never mentioned as purchasing women in this way, except in the case of the Janglis of the Chenab Colony, but the administration of the Sakhi Sarwar shrine in Dera Ghazi Khan appear to carry on a thriving matrinonial agency business.

On the Frontier the trade appears to be declining. In former times part of the revenue of Chitral was taken in women of the Rati or Lal (Red) Kafir tribes, who were brought down to Peshawar by Kakka Khels. These women were sold by height, Rs. 20 a span, equal to Rs. 50 or 60 per foot, being the average price. This traffic is said to have ceased, though Powindahs continue to bring down Kafir women occasionally. The Mohmand Pathans sell women to the Khattaks of Peshawar and Kohat. As a general rule, the women sold by Pathans are those who have been unfaithful, and who, instead of being murdered, are sold as a punishment. It would appear that amongst the higher tribes, who are jealous of the honour of their women, adultery is usually punished with death, or by mutilation, especially the cutting of the foot, but if the guilty couple escape, the husband must be paid compensation in cash and a girl given to his family. This giving of a girl in exchange is called swarrah.

PART III. CIVIL CONDITION.

- 38. Betrothal. As a general rule, it may be said that betrothal is a contract. which, being a preliminary of the religious rite of marriage, cannot be annulled. Thus among the Hindus of the south-west of these Provinces it is a fundamental principle that only impotency, leprosy or an incurable disease can make a betrothal void, and some curious customs arise out of this idea that betrothal is indissoluble. For example, if either the boy or girl becomes dangerously ill, the ceremony of mathe lagawan (touching the forehead) is performed to cancel the betrothal. The ceremony is simple: the boy goes to the girl's death-bed (or vice versa) with some sweetmeat, which he gives her saying 'dear sister, take this sweetmeat," and she accepts it as from a brother. Every effort is made by the sick child's relatives to prevent the other child from coming to perform this ceremony at their house, because, if once performed, no Kirar family will marry with them, while on the other side strenuous efforts, which sometimes result in severe affrays, are made to get at the sick child, and occasionally, in order to obtain access to the house, disguise is resorted to. If these efforts fail, it is sufficient to effect sawan or striking the head against the wall of the sick child's house, and, if the child die, this may be done up to within four days after the death. If neither ceremony be performed, the surviving child cannot get a second spouse. After this breaking off of the contract the betrothal may, however, be renewed if the sick boy or girl recovers and the parents wish it, The ideas underlying these rites appear to be that the betrothal is virtually a marriage, that the death of one party, before the contract is cancelled, makes the other a widower or a widow, and that the survivor as such is so ill-starred that he or she cannot obtain a new alliance.
- 39. Marriage.—Strictly speaking there are two distinct forms of marriage in vogue amongst Hindus in these Provinces. The first is a religious rite, which is in theory indissoluble, for Hinduism recognizes no legal form of divorce, while the second is celebrated without any religious observances. In the case of a woman the former rite can only be solemnized once in a life-time, so that widow re-marriage, if permitted at all, can only be celebrated by the lower rite.

The characteristics of a religious marriage, apart from the ritual, are that the bride should be given, not sold for a price or exchanged, and that she should not have reached puberty, though the latter condition does not appear to be at all essential in this part of India. A marriage at which the bride has been purchased is usur, dwathi, or bata (lit: price), and this is a degree lower than the exchange-betrothal (sata). When no consideration has been paid, the marriage is pun, kania-dan, or Brahm-puj, all three terms denoting the religious character of the gift of the bride. This form of marriage is confined to the higher classes of the higher castes, for in every caste there are groups of lower status who more or less

openly sell their daughters in marriage, or effect exchange betrothals. Marriage when pun is usually celebrated at an early age, but this is not an invariable rule. When the girl is sold or exchanged marriage is often deferred, partly in the hope that a better price or alliance will be obtained by the parents, and partly because it is difficult to find a purchaser for a very young girl. In the ordinary sale or exchange marriage there is no betrothal, and the bride goes at once to her husband's house. Exchange marriages are probably most common amongst Aroras, and are the rule amongst Ghirtlis. The Jats also favour them, but amongst the lower classes of Jats sales must be exceedingly common.

Monogamy.-The religious character of the regular form of marriage renders it equally binding upon both parties, so much so that among the higher castes there is a strong prejudice against a man's taking a second wife during the life-time of the first. Thus the Khatris of the Chopra section only permit a second wife to be taken if the first be childless: the Bhargava Dhusars claim that polygamy is unknown amongst them: the Bhabras retain their rules against the taking of a second wife, while the first is alive, under any circumstances, and the Mohammadan Khojas of Bhera, in Shahpur, who are converted Khatris, claim to be strictly monogamous, so much so that as a rule a Khoja cannot obtain a second wife within the caste, even if the first has died, though he may marry a second wife from outside it. And, generally speaking, it is difficult for any Hindu of good status to obtain a second wife even if the first has died, in his own caste, for there is a prejudice against giving a daughter in marriage to a man already married, and every effort is made to avoid the risk of her becoming a co-wife. Thus in Bahawalpur the boy's hand is examined by the Brahman before his marriage and if the lines show that he is fated to have a second wife, he is first married with full ceremonies to an earthen pot (matki) and then to his betrothed.

Percentage of males who are widowers (all ages).

Subsidiary Table XV, columns 4 and 19.

Widowers .- The difficulty which a widower has in obtaining a second wife cannot be a very real one, for, proportionately, there are twice as many widows as there are widowers, there being 1,363 widows in 10,000 females (of all ages) as against 623 widowers in 10,000 males. And after the age of 15 the proportion of widowed females is much higher, as a comparison of the

marginal figures with those in the inset in the next paragraph shows, hardly any males under 15 being widowers. The aversion to a widower's re-marrying is on the whole highest in the south-east of the Punjab where Jain influence is presumably strongest, and it is precisely in this part that we find that the proportion of widows is generally high. There is also an apparent avoidance of re-marriage by widowers in Chamba, Ambala and Hoshiarpur, in which tracts widow remarriage is also infrequent, though repugnance to the latter practice is shown also by the figures for Kangra and the Himalayan Area generally.

On the whole, then, we may say that widow re-marriage is very generally counter-balanced by a repugnance to the re-marriage of widowers. This can be best seen by marking off the figures which exceed 700 per mille in column 4 and those which exceed 1,500 in column 19 of Subsidiary Table XV,

40. Widow re-marriage,-It is usual to translate the words karewa, dharewa jhanjhrara, by 'widow re-marriage,' but in fact these terms appear to denote all the forms of marriage not celebrated with the full religious rites, and of these, owing to the universal practice of early marriages, the most common is widow re-marriage. In other words, the theory that marriage is a religious rite, which cannot be solemnized more than once in a woman's life-time, leads to re-marriage of a widow being viewed as a form of concubinage. This may explain the rule against widow re-marriage which is found among all the higher classes of Hindus,

It also exists, though not as an absolute prohibition, however, among certain Mohammadan castes, such as the Sayads and Pathans, by whom it cannot be said to have been borrowed from the Hindus, for the same dislike to widow re-marriage exists in the country-towns and villages of Arabia. The prejudice indeed appears to point to a time when marriage was regarded as a sacrament and so inviolable, even death not breaking the bond.

Another explanation is however suggested. It is said that the object of the prohibition of widow re-marriage was to suppress the practice of nyoga which at one time permitted the husband to call in a man of any caste to beget a son on his behalf, though the Hindu jurists restricted the choice to his gentiles, justifying the custom thus modified by the

Apastamba 11. 27. 2-7.

argument that the bride was given not to The nyoga thus closely resembled the levirthe husband alone, but to his family. ate, which permitted a similar course if the busband had died and left no issue. But in neither case was there a marriage, and none of the legal consequences of a marriage ensued. On the contrary, the nyoza left the wife married to her husband as before, and no prohibition of widow re-marriage was needed to suppress the custom.

The probability appears to be that re-marriage of a widow was forbidden in order to prevent any possibility of polyandry being instituted or maintained. was felt that if it were lawful to marry a brother's widow there was a risk of intrigue in anticipation of the husband's death, and on this theory it is possible to explain why widow re-marriage is sometimes allowed, but the widow must not marry her husband's brother: of this rule instances are afforded by the Aroras (in Bannu) and, I believe, by Hindu Tarkhans. There appears to be no absolute rule in any caste in these Provinces forbidding re-marriage to the elder brother, though, as a general rule, the younger brother is regarded as the more suitable, and it is in the nature of things far more usual.

Widow re-marriage is not a question of caste, but of status within the caste. Thus Jats almost always allow widow re-marriage, but families of high social standing and, locally, certain tribes disallow it. Some Alir families also disallow it. On the other hand, Brahmans in certain localities practise it, and so do the lower grades of Khatris.

In consequence our statistics do not show very marked differences in civil condition by age in the various castes. If we take the ages up to 20 we shall find that the Khatri and the Chuhra, castes which stand at opposite poles of the social scale, have much the same proportion of widows. Even when we take

Subsidiary Table III of Chapter VIII.

the Sikh Khatris of the

Khanna section we find only 2'3 per cent. of widows under 20, and the Chuhras (Hindus and Sikhs) show 12 per cent. Between 20 and 40 the latter again have nearly as many widows as the Khatris, and they have a good many more than the Jats. If we could obtain data for the status groups in each caste and tribe, which would be in practice an impossibility, we should doubtless find a very much larger proportion of widows among the higher than in the lower groups, but while we have only figures for castes in the lump, the toleration of widow re-marriage in the lower groups reduces the caste-averages in the higher castes to the level which obtains in the lowest castes. How far the movement in favour of widow re-marriage has led to the re-marriage of young widows amongst the higher

Subsidiary Table XI, Cf. Punjab Census Report, 1892, § 177.

castes I cannot say, but the proportion of widowed females is now less than it was in 1891, and this is the case in each of the main religions. If the proportion of widows is a clue to the restrictions on their re-marriage, the Sikhs clearly do not prohibit it much more than the Mohammadans.

The prevailing view that widow re-marriage is a lower form of marriage, hardy better than legalized concubinage, leads to a curious violation of the law of endogamy. Thus in Karnal a Gujar may marry a Jat or Ror widow, or even a woman of a menial caste, but the woman is then called herri-kui, though it is still a real marriage. At the same time any marriage out of one's own caste, even if with a higher one,

The idea appears to be that if a widow marry at all it does not much matter whether she be married inside the caste or without it, as the social disgrace will be much the same in either case.

41. The sale of wives.—When the lower form of marriage is recognized and widow re-marriage is allowed, there appears to be a difficulty in preventing marriage from degenerating into a temporary arrangement which can be determined at the caprice of either party, though if the husband does not divorce the wife, he is entitled to compensation for her loss. This has led, among many of the Frontier tribes and among the Kanets and lower castes of the Himalayan Area, to a custom under which wives are sold like chattels.

Among the Pathans of the Narra Ilaqa in Pindi Gheb Tahsil, the sale of wives have been reduced to a regular system. A bride is invariably purchased for a sum varying from Rs. 40 to Rs. 200, and the cost of the marriage feast falls on the boy's parents. If a woman, married or unmarried, is abducted, she and her adductor cannot return to the territory of the Pathans, unless the latter agrees to pay Rs. 420 as vani or compensation to her husband and parents. When this sum has been paid the girl is considered to be the abductor's wife, and this form of marriage is called rogha, a term also applied to the sum paid. Of this sum, a sum of Rs. 40, called tikra, goes to the parents even if the girl be married, and if she be unmarried, they take the whole sum. If the girl abducted be of a menial caste, only half these amounts are payable.

Precisely the same custom prevails amongst the people of the Simla Hills, where this form of marriage by sale is called rit, the term also applied to the sum paid.

42. Polygamy.—An attempt has been made to obtain data to show the Sabuidiary Table XVII. Castes which practise polygamy, and the figures are not devoid of interest. It will be observed that the institution is not a matter of caste or status, for it is very common amongst the lower castes, such as the Chamars, Chuhras, Dagis, Nais and several other menial and artizan castes. Among the lower agricultural tribes, especially those of the hills, it is also common, for the Kanets, Ghirths, Gujars and Jats practise it somewhat extensively. In all the above classes the probability is that polygamy is really a result of the institution of widow-remarriage, man taking his brother's widow as he takes the rest of his chattels, but among the Kulu Kanets at least polygamy is a form of investment, as most of the field-work is done by the women, and a man's wealth depends on the number of his wives. This also applies to the Kangra Ghirths, but in a less degree, and probably the short lives of the women in Kangra are in a great measure due to the hard field-labour done by them.

Amongst the higher Hindu castes polygamy is rare. The Khatris only return 224 cases, but the Brahmans admit return 224 cases, but the Brahmans admit no less than 792, a considerable number on less than 792, a considerable number on less than 793, a considerable numbers. Amongst Mohammadans, as might be expected, polygamy is rare. The Khatris only return 224 cases, but the Brahmans admit no less than 792, a considerable number. Amongst Mohammadans, as might be expected, polygamy are returned as polygamy as against 6 per mille among Sikhs and Hindus, so that polygamy, fostered as it is by widow-remarriage, is quite exceptional in all religions.

POLYANDRY.

43. Forms of Polyandry.—There are two recognized forms of the custom of polyandry: (i) the lower or Nair form in which the husbands need not be (and, as a rule, are not) brothers, and (ii) the higher or Tibetan in which they must be brothers.

In the Punjab the latter form is almost the only one which exists, but instances of the lower form occur. In Spiti, a purely Tibetan country, a case occurred in my own experience in which two men, not brothers, took a common wife, and in consequence made their land joint and became brothers. A precisely similar case is reported from the trans-Giri part of Sirmaur, where the custom is said to be that only real brothers ('sons of one and the same mother') may take a joint wife, cousins or step-brothers being unable to do so. But in Kanawar (Tahsil Chini of Bashahr) step-brothers or cousins may marry one wife and specific instances of these practices are quoted. Indeed in rare cases men not related become dharm-bhais or ritual brothers and take a joint wife, usually making their property also joint, but the children of such marriages are considered to be of inferior status. In this tract instances of brothers marrying sisters as joint wives are not rare.

Polyandry as an avowed institution may be said to be confined to the Spiti and Lahul pargamas of Kangra, to Chamba-Lahul, Kanawar and the Saraj or highlands of Kulu and Mandi, though it is doubtless also practised more or less openly by the lower castes throughout the Himalayan Area, and, as a matter of fact, though the custom is not admitted, by the Jats of the plains. Of these tracts Spiti contains a purely Tibetan population, while Lahul, (as some recent anthropometrical data show), and Kanawar have a population with strong Tibetan characteristics, though the former is being rapidly Hinduized.

The practice however is not altogether a matter of locality, but of status, and it is not a little remarkable that, though Tibet has given its name to the higher form of polyandry, in Spiti, which has a purely Tibetan population, monogamy is, as Mr. Diack has pointed out, the rule, and a system of primogeniture prevails, the eldest son succeeding in the life-time of the father, while younger sons are sent to the monasteries: polyandry is only "practised among the dutalpas (or land-less class) and the bushans, or descendants of the monks of the Pin monastery, which requires no vow of celibacy from its members, and these have adopted the custom admittedly for prudential reasons, because they are a land-less class."

On the other hand, the data now obtained for Kangra and Kanawar (in Subidiary Table XVIII.

Bashahr) show that, though polyandry is essentially a Kanet practice, it is also not uncommon among Brahmans, and it occasionally occurs among the so-called Rajputs. No attempt was made to obtain data for any other localities, and the Rawalpindi entries are open to considerable doubt.

44. Succession through females.—It is curious that in Kanawar there is no trace of succession through females, for the children take the clan-name of the father, and there is no tradition of their ever having taken the mother's clanname. Succession of a sister's son is unknown.

In Spiti however there are traces, possibly, of such succession, for in that pargana the Chhota Nono had two families by different wives, and his eldest son contended that they formed one family of which he was the head and sole heir, but the eldest son of the second wife urged that the two families were distinct, and that he as the eldest son of the second family ought to succeed to a moiety of the property.

In the Kulu Valley chheti or a share of land is constantly assigned to a second wife for her separate maintenance and it is claimed that such land is exempt from partition between the husband and his brothers. The term chheti is also applied to land inherited through a female, e.g., by a man who marries an only daughter. In that case her land is not merged in that of her husband but remains distinct, even when he is joint with his brothers, and it devolves, even after two or three generations, only on the descendants of the heiress.†

† Indian Notes and Queries, 1894, section 362.

Gazetteer of Kangra (Kulu), Part IV, page 84. A very similar prohibition (against the marriage of any but the eldest son), with impartible property, exists in Southern India among the Nambudri Brahmans of Kerala.—Calcula Review, 1901, page 132.

By a possible extension of this custom a widow retains her husband's land as long as she remains in his house, and among the Kangra Gaddis this rule is even further extended, so that 'a child born within the four walls of the husband's house' is called a chau-khandu and succeeds to his land however long a period may have elapsed since his death.

45. Succession in polyandrous families.—The rules of succession in cases where a wife is taken by two or more brothers ought to throw light on the ideas underlying polyandry and on its origin, but unfortunately our information is often conflicting. In Spiti there is, as already noted, a system of monogamy and primogeniture amongst the landed classes, and those which practise polyandry have as a rule no property, or so little that partition is not possible, and there appear therefore to be no rules of custom which would govern it.

In Lahul 'among the subordinate landholders all sons are considered entitled to equal shares of their father's holding, but in practice they seldom divide and live on with wife, land, house and chattels in common,' but in the fertile part many have married separately and divided house and lands. In the joint families the custom is that the share of a brother who dies, without issue, goes to the brothers with whom he lived in unison or to his issue, to the exclusion of

Gasetteer of Kangra (Kalu), Part III, page 13. all claim on the part of a separate branch of the family. In Kanawar brothers with a joint wife are joint tenants, that is to say, the survivors succeed to the share of a deceased brother until all are dead, when their sons succeed. The rules as to partition of a polyandrous group are obscure and probably there is no fixed or definite custom. Thus Mr. G. G. Minniken writes:—'When, on account of some cause or causes, the brothers agree to have the joint property divided, the law of inheritance is as follows:—

- (a) For landed property, the eldest brother is entitled, before the division is made, to a good piece of land, the younger brothers getting the house. The balance is then divided among all the brothers including the eldest and youngest.
- (b) Property, other than landed, is divided equally among the brothers and the State (the Raja).'

As a rule, partition must be effected if one brother takes a separate wife, and Mr. Minniken notes:—'In such cases, unless the new wife brought by one of the brothers (who had previously a share in a joint wife), consents to be a joint wife of all the brothers, the brother who has married her, and has brought her, is made to live separately from the polyandric household. But the brother, who has taken a separate wife, is not barred from sharing in the joint wife. The joint wife will however always object to live with the brother who has a separate wife, and jealousy is said to be the cause.

A brother taking a separate wife retains his right to share in the family property; but the property must be divided. The law of division of property is as follows:—If he be the eldest brother he gets a good piece of land in addition to his equal share in the estate, but this is over and above the equal share made to him when dividing the property. The younger brother would get the house in addition to an equal part or share in land and property with the other brothers. If he be neither of these, he gets part, which is equal to the whole property minus a good piece of land, and the house divided into as many parts as there are brothers.'

As regards paternity Mr. Minniken adds:—'In Bashahr,* all the brothers are recognized as father of each of the children born of the common wife, but, for distinction sake, the eldest brother is called (teg babach) or eldest father, the younger brother (gato babach) or younger father, and so on. But ordinarily the eldest living brother is spoken of as father of the children born of the common wife. When disunion among the brothers takes place, and they break up the joint family, the joint wife names the fathers of the different children.'

[·] Amongst the lower classes, in Kanawar, the children, Mr. Minniken tells me, are often assigned by lot.

In Kulu the custom has come into contact with the courts of law, and it is hardly open to doubt that legal fictions have been set up in order to make the institution fit in with our revenue system. Thus Mr. A. Anderson, C.I.E., notes that formerly the woman was deemed the wife of the eldest brother alone and thus all the children were held to be his, but it was proved that this custom was no longer recognized, the wife being allowed to state who the father was in each case and the succession following her allegations. Mr. Diack found that the eldest brother was deemed to be the father of the first born, the second brother the father of the next-torn, and so on. It is thus impossible to say what the actual custom was, if indeed any real or uniform custom ever existed, before our rule.

It is almost impossible to doubt that these customs of polyandry amongst the lower classes and enforced celibacy of all but one son amongst the higher are prudential restraints on over-population. In Sirmaur the custom of polyandry, among the Kanets, is considered a valuable one because it prevents division of the land. So limited is the culturable area in the Himalayas that various other devices are resorted to, to prevent extreme morcellement. Thus the Kanets of Bangahal have impartible wands or lots, and if a man has Lyall, Kangra Settlement Report, § 74. Cf. also only one vand it devolves on the youngest son: if he holds two, the other goes to the

next youngest, and so on.

In Kanawar the State used undoubtedly to directly encourage polyandry by penalizing the division of moveable property, and no doubt indirectly by refusing to allow partition of the holdings.

These conditions find their counterpart in Europe. 'Il faut que la maison fume,' is an Auvergnat saying and to ensure this everything is sacrificed. The cadets of the family remain unmarried and forego their legal shares in favour of the heir appointed by the father.

46. The fertility of married women,-The average number of births registered in the two years 1899—1900° was 918,985 per annum, and the number of married women between the ages of 15 and 45 according to the census returns was 4,007,999 in 1901, giving an average of 229 children per 1,000 wives of the child-bearing ages, as against 198 in 1889-90. The birth returns may now be accepted as fairly accurate, but while they exclude births in cantonments, they include illegitimate births, though the latter are probably a negligible factor in these Provinces, owing to the universality of marriage and the extended sense in which 'marriage' is understood. Unfortunately marriages are not yet registered in these Provinces, so that no data can be given as to the number of marriages in each year and its relation to the birth-rate.

By religions we find that the Mohammadan population in 1899-1900 was appreciably more prolific than the Hindus and Sikhs combined. The former had 237 children born to every 1,000 married women aged 15-45, whereas the Hindus and Sikhs had only 220 per 1,000. It is unfortunate that we have no separate figures for Sikh births, which are now returned as Hindu. These data include the North-West Frontier Province with its predominating Mohammadan population in which the registration of births is most defective, so that the Mohammadan element is undoubtedly even more prolific than these figures show.

Taking the births by sexes, in these two religions, we obtain the somewhat Births per 1,000 married women, aged 15-45.

125

curious result that Mohammadans have, proportionately, more male children than the Hindus. The difference is not great and may be explained by imperfect registration among the Mohammadan population. The figures too are only for two years, 1899-1900. It is much to be regretted that

these data are not compiled year by year in the Sanitary Commissioners' office.

CHAPTER V.

EDUCATION.

1. The Statistics of Literacy.—The statistics of literacy obtained at the recent Census are of exceptional interest, having been compiled on an entirely new plan. In 1881 each person was recorded as (1) "learning," that is to say, as under instruction, or (ii) as able to read and write, or (iii) as illiterate. In 1891

Table C, Vol. III, Census Report, 1892.

the same rule was laid down, but literacy in English was further separately tabulated. On the present occasion the languages in which each person was literate, i.e., those which he or she could both read and write were recorded; but, on the other hand, no distinction was made between those "learning" or under instruction, and those who were literate. In other words, no attempt was made to record the degree of literacy. It will be clear that the Census agency could hardly undertake to examine into people's linguistic attainments, and in several languages, or rather characters, examinations are not held by any authority. It was therefore judged better to record the languages known as stated by each person and not to confine the returns to those who had passed a qualifying examination by a certain standard. Hence by "literate" in the returns of the present Census is meant a person who considers him or herself literate, i.e., able to read or write, and literacy includes every degree of proficiency.

The meaning of the term "language"—By the term language was meant not merely every distinct tongue, such as Arabic or German, but also every different character, such as Gurmukhi, the sacred character of the Sikhs: Lande or Kirarki, the commercial script which has chiefly local forms in the Punjab alone: and the character in use in the ancient Hindu settlements in the Punjab Himalayas, which also has certain local variations, and which is usually termed Tankri, though that name is also applied to the commercial scripts of the plains. These scripts will be described later, but in the meantime it is necessary to bear in mind that the term literacy is not confined to proficiency in the official languages, but includes ability to read and write the rude alphabets in popular use.

- 2. The value of the Census returns,-No attempt will be made here to compare the data obtained in the Census with the statistics of the Education Department. The former comprehend literacy of a kind of which that Department takes no cognizance, and of which it could furnish no statistics; and, on the other hand, the Census returns are doubtless imperfect, because the enumerating staff, having no standard to guide them, had to use their own judgment as to whether a person who could read and write but indifferently well was "literate" within the meaning of the instructions, or not. The tendency apparently was to record mere beginners as illiterate, because, in this as in other matters, the instructions issued for the recent Census were read in the light of those issued on previous occasions; and, as the rule to record those under instruction was omitted, it was inferred that "learners" were not to be recorded. Again, as Government does not, as a rule, teach Lande or Tankri, it was at first imagined that literacy in those characters did not count for Census purposes, though the omissions in the final record, due to this misconception, must have been comparatively few. Briefly, it may be said that the figures for literacy generally rather underestimate than overstate the numbers literate, especially in the case of the popular scripts, and in the school-going ages. On the other hand, the rule that only those who can both read and write should be deemed literate may occasionally have been disregarded, especially in the case of women, who often learn to read Arabic, Gurmukhi and other characters, because they are used in religious books, though they do not learn to write.
- 3. Literacy by religions, British Territory.—Taking the British Districts first, we find that according to the returns the most highly educated community is that of the Parsis, three-fifths of whom are literate. Among Christians only

34,017 are literate, or less than half.

	L	iterates in	British T	erritory.

Hindus	***	***	***	1 in 15	1 in 10
	***	***	***		
Mohammada	103	***	***	1 in 69	1 in 46

(The Sikhs being slightly in advance of the Hindus.)

Of 10,956 Christians between the ages of 10 and 20, only 4,448 are returned as literate. In the other religions the proportions are those given in the margin, and taking the population of all religions we find that unit in 16 to 15 in

Native States.—The population of the Native States is not so advanced. Out of some 4,425,000 souls, 119,500, or only one in thirty-seven are returned as literate, the most highly educated communities being the Christians and Parsis. The former are in the Native States mainly Europeans or persons who

Mohammadans		***		1 in 98	1 in 70

have had an English education, and form a small community of only 780 souls, while the Parsis number only 32. The other religions show the proportions given in the margin. In both cases the

order of merit is nearly the same. The Jains stand far ahead of the other religions, while Buddhism takes second place. Sikhism, which has borrowed much from Buddhistic ideas, should have taken a better position, but in the Native States the Sikhs appear to be far behind the Hindus in education. The Mohammadans, despite their literary activity, are, as a body, exceedingly backward, in both instances.

4. Comparison with the returns of 1891.—For the reasons already noted the present figures undoubtedly exclude many learners. If we assume

that no learners are now included in our figures for literates, we could infer that there had been great progress in British Territory, but marked retro-gression in the Native States. But we cannot make that assumption, and assuming that the majority of the learners have still been returned as literate we find that there has been some advance in British Districts, while in the Native States education is far more backward than it was ten years ago. The figures in the marginal table show that in British Territory we have now 162,956 more literates

to set off, against 166,683 learners in 1891, while the Native States return 5,676 fewer literates, or, adding the 13,779 learners of 1891, no less than 19,455 fewer learners and literates combined than in 1901. To this unsatisfactory result the Sikh figures are an exception, for the Sikhs in British Districts 264

return 18,567 more literates, including learners so returned, than in 1891 and show a substantial advance also in the Native States. The Hindus are practically stationary in British Territory and retrograde in the Native States, while the Mohammadans appear to be retrogressing in both, for they return 19,431 fewer literates, including learners, than in 1891.

This condition of affairs in Native States Territory merits further notice, as no educational statistics are available in this case. It appears that in British Territory, of the population aged 15—20, 1 in 19 is returned as literate, whereas in Native States the ratio is only 1 in 29, so that at the age when secondary education is being imparted the States seem to be behind-hand, but it must be borne in mind that from the ruling chiefs downwards, many of their younger men are being educated in schools and colleges in British Territory. How far the decrease in the numbers of educated people in the States is due to an increasing tendency on the part of educated men in the Native States to seek their fortunes in the British services or in trade in the British towns I cannot say, but it is not impossible that the superior advantages of service under the Crown and the greater scope afforded to enterprise in British Territory are attracting more and

more some of the best elements in the Native States. This suggestion is borne out by the fact that the number of literate females in the Native States has actually risen since 1891, and this in spite of a decrease in

the number of Mohammadan females returned as literate.

5. Literacy by Districts and States .- Taking males only, the proportion

Subsidiary Table V.

Districts and States as much as one

in the different Districts and States as much as one might have anticipated, as it only ranges from 33 per mille in Kurram to 101 in Multan, which appears to have the most generally literate population in these Provinces. That this is

of literates to the total population does not vary might have anticipated,

not due altogether to a numerous literate population in Multan town and cantonment is evident from the fact that Jhang also contains a high proportion ot literate males,

and indeed the Districts of the South-West generally have a good proportion of literates. Of the Natural Divisions the Indo-Gangetic Plain is distinctly behind the rest of these Provinces, for, though it includes the cities of Delhi, Lahore and Amritsar, it has only 60 male literates per mille as against 66 in the Himalayan and Sub-Himalayan and 70 in the North-West Dry Area. This is possibly due to the system of caste which practically forbids the lower classes to accept education, whereas in the South-West and trans-Indus there is no such restriction. It is precisely the same with female education, for, in spite of such exceptions as Delhi, Lahore, Amritsar, Ludhiana and Gujranwala, which return over 4 literate females per mille, female education in the Indo-Gangetic Plain is back-

advance in literacy, yet it only returns 9.8 per mille more male literates than in 1891. The most progressive Districts noted in the margin, together with the three which have retrogressed most. It is noteworthy that only two States show an actual falling off in the ratio of literates since 1881, vis., Patiala (10 per mille) and Dujana (1.6 per mille).

7. The Provincial Vernaculars.-In the Census instructions the term 'language' was used, loosely, for 'scripts' like Gurmukhi, Landa and Tankri, which are in reality not 'languages' at all, as they are not spoken dialects or tongues, but systems of writing. The term 'written character' would have been better. Nevertheless the data obtained are probably fairly accurate, as the intention of the rule was generally grasped. They illustrate, though only imperfectly, the extremes to which variations in usage are carried in this part of India. fust—as we shall see in the next chapter on language—as there is a tendency for each religion and for each trade-guild to develope a sacred dialect or a commercial argot of its own, so the main religions and the literate castes appear to evolve more or less consciously distinctive scripts.

At the same time we must carefully distinguish between the written script and the spoken language. It is characteristic of Indian society, in these Provinces that there should be a good deal of cross-division in this respect. Thus Gurmukhi is not necessarily the character in which Punjabi is written, nor would and nothing else necessarily speak Punjabi. The holy Granths of the Sikhs are

Resme's Communative Grammar, Introduction, written almost entirely in the Gurmukhi

page 94.
Trumpp's Adi Granth, Introduction, page cxxv. nated it.

character, but their language is the old Hindi, or Hindui as Dr. Trumpp desig-

Gurmukhi.-Like Sanskrit, Gurmukhi was essentially a sacred script. Adopted, by altering the significance of certain letters in the Devanagri alphabet. But Dr. Trumpp considers that the Garmukhi letters were in use before the Sikh Guras and not invented by them. Gura Angad received the janam-patri of Gura Nanak written in shastri, and so a Mokha Khatri had to be sent for to transil-terate it into Gurmukhi. The notice is certainly modifying the forms of most of the remainder and reducing the number of characters from the 52, or bawan-akhri, of the Sanskrit, to 35 (whence the term painti applied to the Gurmukhi alphabet), the Introduction to the Adi Granth, page xlviii, Sikh Gurus appear to have consciously

invented a new script for their religion. Mahajani, Hindi, Landa, Munda, Tankri, Kirarki, or Rori.-Landa, literally the docked or tailless script, is the term most commonly applied to the various forms of commercial script in use in these Provinces. It is taught, by paahas, in a sort of nursery rhyme, of which the following is the Rohtak version :-

- 1. K. Kakka re Kewalia. 3. G. Gagga Jori ga.
- 5. A. Age nanna motkra.
 6. Ch. Cham chire ki chaen chaen.
- 8. J. Jajja jiwal banya. 10. A. Age nanna pakri.
- 266

- 2. Kh, Khakha ghundi chiria.
- 4. Gh. Ghagga ji ka lotkra.
- 7. Chb. Chhachha bandha potla.
- 9. Jh. Jhajja jhar ki lakri.

- 11. T. Tatte se tut ge.
 13. D. Dadda gode ganth.
- 15. R. Rane pa pirane.
 16. T. Tatte se takhle.
 18. D. Datta diwati diwatye.
- A. Age nanna hore ja.
 P. Pappe se paothe.
 B. Babba bari baingna.
- 25. M. Mamma lekam sar ka.
- 27. L. Lala tap subali ke. 29. S. Sasse satam ke.
- 31. A. Are gare posti. 33. Ai. Ai re do bhai re. 35. U. Uka munh ju de.

- 12. Th. Thattha thok bhiraiyan.
- 14. Dh. Dhadha dhukar puchhri, 17. Th. Thathe chabawen bakle.
- 19. Dh. Dhadha dhan chahori ja.
- 22. Ph. Phaphyan ke phate pa.
- 24. Bh. Bhabba munjh katar ka. 26. R. Rara karam katara.
- 28. A. Awa tale binduli. 30. H. Haha har ke nam le.
- 32. R. Rale bindi rale. 34. I. Ikri men tikri.
- 36. A. A pani pya de.

It will be seen that there are 36 rhymed lines, but only 33 letters, a long being repeated four times (Nos. 5, 10, 20 and 36), and Nos. 5 and 10 being of the same shape. The rs, Nos. 31 and 32, are both hard and 'have very nearly the same sound, but their shapes are quite different. The rhymes are mostly unintelligible now, but several clearly refer to the form of the letter. Thus No. 2 is in the form of a knot (ghundi), No. 7 is a bundle (potla), No. 9 is like a thornbush (jhar), No. 14 has a tail (puchhri), No. 18 resembles a lamp (diwato), No. 23 is like the baingan plant.

Tankri or Tankre.- This term appears to be used of two distinct characters-(i) the Tankri* of the Eastern Himalayas, and (ii) the commercial script of the plains. The Hill Tankri is also known in Hoshiarpur as Pahari, as distinguished from the Lande. It has numerous local variants, the most highly elaborated being that of Suket and the rudest that of Sirmur.

The Tankre of the plains is practically the same as the Lande-indeed the terms are said to be used indiscriminately in Attock. In Delhi there are two local variants, and a third, said to be used by Punjabi Mohammadan merchants. which is quite different to the other two.

Sudi .- The Suds, as a caste, appear to have a kind of caste-script of their own, at least in Simla, just as the Bhabras in the South-West of the Province have a special written character.

Hindi.—There is a common saying that 'Hindi barah kohen badalli hai' or 'the Hindi writing changes every 12 miles,' and the result is that the writing of one tract is unintelligible in another even a few miles away. Thus in the Lahore District there are at least three types, one in use in Lahore and Kasur, another in Chunian and a third in Sharakpur Tahsil. In Ludhiana the character used in the District is called mahajani, the form in use across the Sutlei being distinguished as Lahori. In Dera Ghazi Khan there are three distinct varieties, (i) in use at Vehowa and Sanghar, (ii) used in Jampur and Rajanpur, and (iii) used in Dera Ghazi Khan. In Bahawalpur, which lies on the borders of Sindh, Rajputana and the Punjab, there is a bewildering variety of written characters which illustrates the tendency of each trading-caste to evolve its own type, There are (i) a Siri-de-akhar, with a sub-variety called Sidhu or Kharori-akhar, (ii) the Puchwale or Uch-ki-akhar, first used at Uch, (iii) the Shikarpuri or Sindhi, chiefly used by Sindhi Aroras, who are becoming important in the State, (iv) the Satatmi or Multani used by the Khatris and Kirars of the Ubha tract. (v) the Marwari or Bhabri of the Bhabras, (vi) the Shastri, the character used by Brahmans, and, curiously enough, by Hindu goldsmiths; (vii) the Guzerati akhar, (viii) the Lande, used by Punjab traders settled in the State, (ix) the Nagri akhar, also called butti (or naked), shastri used by the Ubha Kirars, (x) the Tankri or Takri used in the Ubha villages, and (xi) numerous varieties of the Karki or Kirakki used by village shop-keepers, so diverse that the accounts of one village are not intelligible in another, and so vague that 'Takri bana-ghin-qa' (lit: he has written his accounts in Takri) means 'he has fudged his accounts.' It is noteworthy also that Gurmukhi, used by the Sikhs and the pujaris of the dharmsalas in this State, is extending, and that some of the women of the Kirar families now read and write it.

Thakuri is not, I think, the term for any character. Tankri would not appear to be derived from Thakur.

Not only do these local variations make the Mahajani Hindi a kind of cryptogram to outsiders, but the absence of vowel points renders it often a puzzle to one's correspondents and many amusing stories illustrate this. Thus a man once wrote home:- 'kari bech-kar-muamala ada kar-dena', or 'sell timber to pay the revenue,' but kuri was read for kari, and his daughter was sold. Once too a merchant wrote from Delhi :—' Delhi pahunch kar lut lite' —' We reached Delhi and were plundered.' This was read lote lite, i.e., 'on reaching Delhi we purchased pots.

Tibetan .- There are two scripts in use, the one called Bhumi being used for the Buddhist religious books. This is generally learnt by the Kanawar people, even by the women. The other is known as Thai and is used by the trading classes in Tibet and Upper Kanawar for commercial purposes. In their knowledge of the sacred character the Buddhist women strikingly resemble those of the Sikhs, who frequently learn to at least read Gurmukhi.

8. Literacy in Provincial Vernaculars.-The figures in Table VIII of Part II require some explanation. A very considerable number of literates returned themselves as knowing how to read and write two or more languages, and in such cases each language returned has been shown. Thus, if a person was literate in Urdu, Hindi and Pashto, he was first tabulated as literate, and then as literate in each of those three languages, so that he appears in columns 5, 11, 14 and 20 of the Table. In tabulating this principle was observed consistently throughout. I shall return to the data for literacy in more than one language presently, after discussing the figures for literacy in the Provincial Vernaculars as they stand.

It may first be noted that in both Provinces, including the Native States,

	Persons.					
Literates			***			976,653
Urdu	***	***	***	***		367,871
Lande	***	***	***	***		245,843

Tankri	***	***	947	***		30,072
Tibetan	***	***	***	***	***	1.018
Pashto	***	***	***	***		696

these vernaculars are returned in the order shown in the margin, Urdu being the most generally known. These figures, however, require some modification. Under Hindi and Tankri considerable numbers who really use Mahajani or Lande have undoubtedly been returned,

but, on the other hand, no less than 39,523 souls (including 1,567 females) have been returned as knowing Sanskrit, by which must in many, if not in most, cases be understood the Shastri or Devanagri which should have been returned as Hindi. However, the figures give a very fair idea of the extent to which the indigenous scripts have been retained side by side with the official and literary Urdu and English.

It would be of little interest in discussing the data to distinguish between British and Native States Territory, but the figures for each religion merit notice. British and Native States Territory, but the nguies to cach tonger.

Amongst Hindus Lande is far more widely known than Urdu or Hindi, and Gurmukhi is returned by

Total	***	***	•••		***	603,148
Lande	***	***	***	105	***	218,792
Urdu	***	***	***	***	***	162,001
Hindi	***	***	***	***	***	134.602
Gurmul	khi	***	***	***	***	81,607

81,607 souls, of whom 8,213 are females, showing the extent of the influence of the 'Sikh' sacred writings amongst the Hindus.

The Tankri script is virtually confined to the Hindus, amongst whom are also to be found most of those who use the Hindi or Lande. Tibetan is also returned by nearly 400 Hindus, who are probably recent converts from Buddhism.

Amongst the Sikhs Gurmukhi is the most used script, but considerable

Sikh literates.			Mohammadan	literates	
Total	990	118,445	Total	***	207,128

Hindi ***	900	6,073			

numbers use the Hindu commercial characters, as do many of the Mohammadans, among whom Urdu is, however, by far

the language most usually returned.

268

Amongst the Buddhists Tibetan is practically the only language known. It is returned by 579 persons, including 32 women, and only 8 persons know Urdu or Hindi.

The trading community of the Jains uses chiefly Lande, returning 8,163 (8,099 males and 64 females), but Hindi is returned by 3,247 and Urdu by 2,980 persons. Gurmukhi (82), Tibetan (27) and Tankri (33) are also returned. 231 Jains, including 34 females, returned Sanskrit.

Multiple Literacy.—A striking feature of the returns is the number of people who can write more than one language. The Provincial scripts are no doubt very diverse, but all are based on the same phonetic system, so that a man

who has mastered one script probably finds it easy to learn a second or even a third. The uncertainty of the English system of phonetics is doubtless a great obstacle to the increase of literacy in English, as it cannot be learned without a teacher.

Of the total literate in English nearly two-thirds, or 63,171, also know Urdu and, if we exclude the Christians, it is quite the exception for an educated native to know English and not know Urdu. Further the scientific phonetic system of the oriental scripts enables a person who has once mastered the Sanskrit character to acquire Hindi and its allied scripts, while anyone who has learnt the Arabic alphabet can learn to read and write Persian, Urdu, etc., with little difficulty. Hence we find that while Christians are rarely literate in more than one language, Hindus

lindus literate in Un	du	125.399	Hindus literate in Englis	
nd also in liindi	***	11,823	And also in Urdu	. 36,60:

			Total	62.779

who have acquired Urdu can very often read and write at least one other language, while in the case of one who is highly educated enough to have learnt English and Urdu there is an equal chance that he will also know a third language or script.

At the recent Census the rule laid down was that all the languages in which a person was literate should be recorded, the best-known language being entered first. In tabulation however it was found to be beyond our ingenuity to show literacy in more than two languages or to exhibit the best-known languages in an intelligible form, and we had to be content to show literacy in two scripts.

9. Literacy in English.—The figures for literacy in English are of special Literacy in English. interest, and the actual

interest and the actual figures are given in the margin. Of the total literates in both Provinces just over 1 in 10 knows English, but the ratio falls to 1 in 11 amongst Mohammadans, 1 in 14 amongst Hindus and to 1 in 20 amongst Sikhs, in British Territory alone, while it is still lower in the Native States.

Progress in English Education.—Taking the figures as they stand we find that, amongst males only, the number literates in English is 63 in 10,000 as against 30 in 10,000 in 1891, or in other words the proportion has more than doubled. The increase is 33 in 10,000 in British Territory as against 23 in the

Native States. In only six Districts does the percentage even now exceed

				Eng	glish in 10,000 he population
Rawalpindi	***		***	***	19'4
Labore	***	***	***	***	19.1
Delhi	***	***	***	***	14'4
Peshawar	***	**	***	***	11.2
Ambala	***		***	***	11.0
Simla-and	States	***	***	***	10'2

10 per 10,000, and nowhere is it over 20, and in these Districts the comparatively high ratio is clearly due to the numbers of the European population. In Amritsar, with a large commercial city, but no

military cantonment, and only a small European community the ratio is only 6'4 in 10,000. With such small numbers it is hardly worth while to discuss the District figures, but it may be noted that progress has been greatest in the first three of the six Districts above mentioned.

10. Female education.—In every 10,000 of the population there are only 15 females who can read and write, or to take the female population alone, there are in every 10,000 females less than 34 who are literate in that sense. Women however often learn to read, and as our returns only include those who can also write, these figures make the female population appear somewhat more ignorant than it really is. Nevertheless the figures show how backward female education is, but there has been considerable progress since 1881 for the number of literates then was 9 in 10,000 females, whereas now it is 34,000 nearly four times

Subsidiary Tables V and VI. as many, and since 1891 it has more than doubled. In English indeed the progress made has been much slower, for ten years ago 4 in 10,000 knew English, and the present figure is only 6. It follows then that female education is only making headway in the indigenous languages.

Its character.—If we take the actual numbers returned it will be found that out of 42,432 literate females in these Provinces, 7,831 are Christians, and of these again 6,834 know English. Thus there are only 34,601 literate non-Christian females, and of these only 760 can read and write English, the remainder being literate in Provincial vernaculars, so that if we exclude the Christian literacy in English is a negligeable quantity amongst females.

By religion.—Taking the figures for each religion we find that they stand

				Literate femal	es in 10,000 :
				of the total population.	of the female population.

in order of merit as given in the first column in the margin. And if we take the female population alone we shall find that the order of merit is the same, but that amongst the Sikh women are far more frequently literate, in proportion to their numbers, than the Hindus. Indeed it is the comparatively large number of female literates among the Sikhs

which makes them a slightly better educated community than the Hindus, in British Territory, for if we exclude females we find that the Hindu males are just a shade ahead of the Sikhs.

In the Provincial Vernaculars.—Another point of interest is brought out by the data for literacy in the Provincial vernaculars. Hindu females usually

Female literates per 10,000 in each vernacular.

				Hindus.	Sikhs.	Moham- madans,

i. Hindu females usually learn Gurmukhi, but considerable numbers also learn Hindi or Mahajani and even Urdu. Sikh females however seldom learn any language but Gurmukhi. Mohammadan females learn mainly Urdu but 4,247 in 10,000 literates of the sex are, literate in 'other language's,

II. Literature.—The Subsidiary Table III, appended to the next chapter. shows the books published in each language during the past decade, but I notice it here because it shows rather the books published in the different written characters, and illustrates not so much the polyglot character of the Punjab populaactes, and interactes not acquire as the diversity of the scripts to which its literate members are subject. To acquire an intimate knowledge of Panjabi literature one would have to learn to read Persian, Sanskrit, Gurmukhi, Mahajani and their variants, in addition to learning the various languages and their dialects. For example, we find Urdu books published in four written characters, Persian, Nagri, Roman and Gurmukhi, and Punjabi in eight, including these four, and Sindhi, Mahajani, Lande and Arabic. On the other hand, we have Hindi and Sindhi books printed in Gurmukhi. Of the written languages Urdu is the favourite, some 47 per cent. of the books published being in that tongue. Panjabi comes next with about 20 per cent., then English with nearly 7 per cent., and Hindi with 4 per cent. of the published The subjects covered by those books, which are those registered under the Act (XXV of 1867), are of very different degrees of importance. A large proportion of the works are educational, and this especially applies to the English and Urdu publications. Taking the essentially indigenous books in Panjabi, Persian, Hindi and Sindhi one is struck by the number of works on poetry and religion. As a rule the literary activity of the Mohammadan writers is centred on religious works, and Islam usually publishes each year more books on religious questions than all the other religions put together. The books in Panjabi are mainly poetical, as are those in Hindi and Sindhi. It is a little disappointing to find that the literary efforts of Hinduism are limited, for the most part, to mere recensions of the older works on mythology and legend, or to controversial works on social questions, such as infant marriage, widow remarriage and the like. The Sikhs, in proportion to their numbers, show greater activity, and there has been a strong separatist movement in the past decade advocating the abandonment of Hindu customs.

CHAPTER · VI.

LANGUAGE.

Bibliography.—The last decade has not been unfruitful in works which have done much to systematize our knowledge of the vernaculars of the Punjab. In 1895 some rough, but most instructive, notes on the Grammar of the language spoken in the Western Punjab, by the Reverend Trevor Bomford, were published in the Journal of the Asiatic Society of Bengal. In 1866 Mr. A. H. Diack, C.S., published his "Kulu Dialect of Hindi." This was followed in 1868 by the Grammar and Dictionary of Western Punjabi by the Honourable Mr. J. Wilson, C.S., C.S.I. The value of both these works is much increased by the addition of folk-songs, proverbs, etc., in the languages with which they deal. In 1900 Dr. Jukes, M. R. C. S. of the Church Missionary Society, Dera Ghazi Khan, published a valuable Dictionary of the Jatki or Western Panjabi language. The late Mr. O'Brien, C.S., left some notes on the Kangra Dialects in manuscript and a Gadi Grammar, with folk-songs etc., in print, which have now been all published in the Kangra Gazetteer, revised edition. On the Sansi dialect some excellent notes by the Reverend T. Grahame Bailey B. D., M. A., Wazirabad, were published in the Journal of the Asiatic Society of Bengal, No. 1, of 1901, pages 7—14. These have been re-printed separately, with notes by the same author on the Secret Words of the Qasais and Chuhras, and the Argot of Punjabi Gamblers.

In Tibetan nothing seems to have been done in the Punjab, but the Asiatic Society of Bengal in 1901 published a Sketch of Ladakhi Grammar by the Reverend A. H. Francke of the Moravian Mission at Leh, and a collection of Ladakhi Proverbs by the same author in 1902. In Pashto much has been done. In 1901 Captain Roos-Keppel published a useful Manual of Pashto, and in 1902 Mr. J. G. Lorimer, C.S., C.I.E., published his Grammar and Vocabulary of Waziri Pashto, which contains more information than I could condense in this chapter.

The classification of the Indian languages.—The Linguistic Survey of India has not yet reached the Punjab—though Pashto and the Iranian languages (except Balochi) have been surveyed—but Dr. G. A. Grierson, C.I.E., who is in charge of the Survey, furnished the Census Commissioner with a classified index of Indian languages to which he prefixed a valuable introduction. The following pages would not have been written without this assistance and Dr. Grierson's classification has been rigidly adhered to throughout.

In his index Dr. Grierson groups the Indian languages as follows:-

(A). Indo-European Family; Iranian Branch.
Aryan Sub-Family. Indian Branch.

(B). Munda Family. { Himalayan and trans-Himalayan Group. | Naipali-Himalayan Group. | Burma Group.

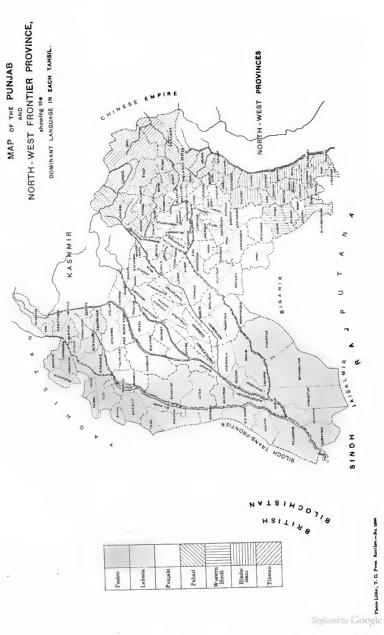

(C). Tibeto-Burman Family.

H. Malay Family.

J. Sinitic Family.

The Iranian Branch of the Aryan Sub-Family is divided into two groups, a western and an eastern. Persian is the typical language of the former. The latter includes Balochi, Pashto and the Ghalchah languages of the Pamirs. The

These notes were based on material collected by the late Mr. E. O'Brien, C.S., author of the Multani Glossary.

Western

Hindu-

Punjabi

Pahari

Pashto Labnda Tibetan

Indian Branch is the one with which we are chiefly concerned. It is divided into 9 groups, 3 of which include languages ordinarily spoken in the Punjab:—

- 1-2. West and East Kafir.
 - 3. Shina-Khowar.
 - 4. North-Western .- Kashmiri, Lahnda, and Sindhi.
 - 5. South-Western .- Marathi, etc.
 - 6. Western.-Gujarati, Punjabi, Rajasthani, and Western Hindi.
 - 7. Northern.-Pahari.
 - 8. Central.-Eastern Hindi.
 - 9. Eastern.-Bihari-Bengali, etc.

In Part I of Table X will be found the figures for every language and dialect returned in the Census of the Punjab (including the North-West Frontier Province) classified in accordance with the above scheme.

2. The classification of the Languages and dialects of the Punjab.

—As regards the classification of the Indo-Aryan languages spoken in the Punjab, Dr. Grierson remarks:—

"the Index is based on the lists of dialects and languages which have been sent to me (with specimens) from every District and State. They are, no doubt, in the main, accurate, having been compiled by local officials endowed with local experience. Their principal flaw, from the point of view of the Census, is the inevitable one of surplusage. They contain numerous ammes of dialects which are mere synonyms of other names—local terms for local forms of speech which differ so slightly from the standard that they are not worth recording in a Census. There can be little doubt that nearly all of these names will disappear in the process of the inquiries of the Linguistic Survey".

3. The results of the Census compared with those of the Linguistic Survey.—It was however clearly the best and safest course to record, in the actual Census, the dialects as returned by the people themselves, leaving their final classification to a linguistic expert. But there are two great obstacles to a complete record on this simple basis. In the first place a man will seldom admit that his language is jangeli, or if he is at all educated, Punjabi, just as few people in England will plead guilty to a provincial accent. It is always the people a little further on, a little deeper in the hills, whose speech is jangli or pahari—of the desert or of the mountains, In the next place every official is more or less of a linguistic expert himself and quite ready to inform you how each dialect should be classified, with the result that all detail as it were, disappears, and many minor but distinct dialects are not fully returned.

To some extent then the attempt to obtain precise statistics of the numbers speaking each dialect has failed, because, for example, we find that only 19 persons are returned as speaking the Kuluhi dialect of Hindi. From this it must not be inferred that the Kulu people now speak another language but simply that the local authorities did not understand what was required. It cannot however be said that our figures throw no light on the varieties of the dialects spoken in the Provinces of the Punjab and the North-West Frontier.

Taking the returns of the Census and comparing them with the data supplied for the Linguistic Survey one finds that they agree in essentials. If the former err in ignoring detail, the latter may point, as Dr. Grierson says, to greater divergences in essentials than really exist.

4. The distribution of languages of the Punjab and North-West Frontier Province, and the numbers speaking each language.—
The term 'Provincial Vernaculars' requires some comment. The Punjab is surrounded by countries which are, with the exception of the North-West Provinces, inferior to it in fertility and resources, and the races who inhabit them have been for generations pressing in upon it. Nevertheless the great mass of its population speaks Punjabi or dialects closely akin to it and it is solely on its extreme borders that Balochi, Pashto, Bhotia and Kanawari, the only foreign tongues of any numerical importance, are to be found.

1. Iranian Branch. Western Group.

5. Iranian Branch.-Persian and Parsi are the only two languages of the Western Group of the Iranian Branch returned, and both are spoken by immigrant races. Under the former 6,364 souls are returned as against 7,032 (including Turkistani, Kandhari and Ghazni) in 1891. 80 persons speaking Khorasani should perhaps have been added to the present figures, but only 6,303 immigrants from Persia are returned in Table XI. It would thus seem that Persian immigrant families retain their language. Rawalpindi (1,313) and Ludhi-ana (598) return most Persian-speakers in the Punjab. It is also spoken in the Frontier Districts of Peshawar, Kohat Table X, Part IV, page ziv, Vol. 11. and Kurram. Out of the 523 Zoroastrians in the two Provinces only 38 return their language as Parsi, showing how readily

that enterprising people acquire a new tongue while preserving their national

ii. Eastern Group.

Ditto.

- 6. Balochi.—Balochi is now spoken by 40,644 souls in the two Provinces as against 35,550 in 1891 and 25,748 in 1881. It is practically confined to the Dera Ghazi Khan District, in which however the proportion of its speakers continues to increase, being now 8, as against 7 per cent. in 1891, of the population. Outside that District the language is hardly spoken at all, except in Bahawalpur, which returns over 2,000 persons as speaking it. The above figures do not include the trans-Frontier tribes of Dera Ghazi Khan who speak Balochi. They number 24,000 souls. Balochi then cannot be said to be a decadent language. The Baloch population of the two Provinces amounted to 416,802 in 1891, and is now 469,420 (excluding the trans-Frontier tribes), but outside Dera Ghazi Khan very few speak Balochi. In that District nearly 23 per cent., in Bahawalpur only 3 per cent., and elsewhere less than 1 per cent., of the Balochis retain its use.
- 7. Pashto.—Pashto is returned by 1,194,561 persons or nearly 4'5 per cent. of the population of the two Provinces. It is, however, mainly spoken in the North-West Frontier Province in which 1,142,011 or 54 per cent. of the population return it, and to these must be added 856 persons speaking Koliati and 124 speaking Peshawari-mixed dialects of Pashto and Lahnda. Thus only 52,550 persons in the Punjab speak Pashto and many of these were most pro-bably Pathan immigrants for the winter months who had not returned to their homes by the night of March 1st: 1901. Pathan soldiers enlisted in the Army must also be allowed for, e.g., in Lahore and Multan. Still there remains a strong Pashto-speaking element settled in Rawalpindi, (20,637, of whom 12,330 are in Tahsil Attock), and in Mianwali, 15,265, (of whom 13,273 are in Isa Khel Tahsil). The above figures do not include the Pashto-speaking population of the Shiranni country, some 12,000 souls, but they include 52,501 persons, who speak Pashto, in Kurram. Deducting the latter the net increase in the Pashtospeaking population of the two Provinces amounts to 85,207 persons, and the proportion has risen since 1881 thus :-

1881-3'98 per cent.

1891-4'21 per cent. excluding Kurram.

1901-4'46 ,,

The Pashto dialects-Pashto, as is well-known, is divided into two great branches, the northern or hard, Pakhtu, and the southern or soft Pashto. southern limit of the former is a line drawn from just south of Thal in Bannu, and running due east almost to the Indus: thence it turns north, so as to exclude the Akhora dialect, of the Akhora branch of the Khattaks, which belongs to the southern branch. The northern thus includes the Afridi, Bangash and Yusafzai tribes, with those of the Chachh plain in Attock, Buner, Swat, and Bajaur. How far it extends to the west we do not know, but underlying, as it were, the Pashto lanuages is a lower stratum of indigenous tongues. Such is the Ormuri or Bargista, 'an independent Iranian language, spoken round Kaniguram in Wazinstan,' by the Chamkannis. Other such languages are the Tirahi, still spoken in Tirah by the tribes subject to the Pathans, and the Dehgani, which forms a connecting link between the Hindki of the Indus and the Kafir language, Our knowledge of these ancient languages is very slight, so that it is hardly possible yet to say how far they have influenced the Pashto dialects, which appear to be numerous. Regarding these also very little is known, but the following note shows that there are well-marked differences: -- The Orakzai dialect

differs from that of the Afridis, in that it is broader, but less guttural, and spoken more rapidly. The differences however are Orakzai. Afridi. English.

Atridi.
... Tiga
... Gunga

not confined to pronunciation but extend to the vocabulary and even it seems to some inflections. The speech of the Aka Khel, one of the seven main divisions of the Afridis, differs from that

of the Orakzais in a very marked degree.

8. The North-Western Group.—This group includes Kashmiri on the II.—Indian Branch. north, and Sindhi on the south, both languages spoken almost exclusively by immigrants into the Punjab from Kashmir and Sindh. Between these two languages lies the Lahnda, the only representative of the group indigenous to the Punjab. Kashmiri and Sindi need not be described at length, but Lahnda merits full discussion.

Kashmiri.—Nowhere in the Punjab is Kashmiri an indigenous language except possibly in Chamba where it is spoken by I per cent. of the population: everywhere else the border line between Kashmiri and the Provincial Vernaculars is situated in Kashmir territory, and the 7,841 persons returned as speaking Kashmiri in British territory must be all Kashmiri merchants or artizans who have settled in the Punjab. The language is highly inflectional and not only offers forms of reduplication but makes various changes in the base: its vocabulary is said by most learned Kashmiris to be polyglot, every 100 words vocability is said by host learned transmiss to person, every too words containing 25 of Sanskrit origin, 50 Persian and Arabic, 15 Hindustani and the remaining 10 Tibetan, Turki, Dogri and Punjabi. How far its influence may be traced in the sub-dialects of the Jammu and Murree hills is a question as yet undecided.

Sindhi.-Sindhi is indigenous to the Punjab only in Bahawalpur, which returns 25,575 out of the 27,980 Sindhi-speaking persons in the Province. As in Kashmiri the changes in the base mark a partial retention of the Sanskrit inflectional system, lost in the more advanced languages of Punjabi and Hindi.

9. Lahnda or Western Punjabi.—This is the name which Dr. Grierson has, in consultation with Mr. Harvey, formerly of the Punjab Educational Department, adopted as the generic term for the Western languages of the Punjab. It was formally recognised in the last Census as Jatki. 'Lahnda', writes Dr. Grierson, 'is a very widely-spoken language extending from the borders of Sind up to and beyond the Murree Hills. Although influenced by the dominant Punjabi spoken in the Province, it is much more nearly connected with the Sindhi and Kashmiri than with that language. So much is this the case that difficult words in Kashmir Chronicles have actually been explained by a reference to Mr. O'Brien's Multani Glossary.'

Dr. Grierson further points out that the language of the five rivers is really Lahnda, not Punjabi, and he remarks that the eastern boundary of the former commences in the north at Ramnagar, in Gujranwala, and runs in a straight line to the north-east corner of Montgomery, and thence across that District to the south-west corner. Lahnda, in his classification, includes the following dialects :-

erial No.	Dia	lect.			Distributio	on,		Numbers return- ed in Census of 1901.
48	Lahnda	··· Diala		Western	Punjab		•••	
	4 -11				ne San A	ange.		
49		or Awanki				***	***	621
50	Chhibhali	•••	•••		(Murree Western F		Kashmir	•••

	Chinawar, Banks and Muzaffar		the Chenab in Gujran	wala,	Jhang 165	
			Dera Ismail Khan	•••	526,577	Total 2,243,198

Thus the total number returned as speaking Lahnda and its dialects amounts to 3.337.036° or over 12 per cent. of the population of the two Provinces. That this is below the real number will appear from the details given above. It can hardly be supposed that only two people speak Tinaoli, that none now speak Chibhali or Dhundi and only 16 Kachhri. Probably a certain number have been returned as Hindki-speaking, or under Pothwari, but the figures for Punjabi in Peshawar (149,346), Hazara (43,152), Kohat (39,317), Bannu (31,112), and Dera Ismail Khan (30,815), Districts in which, making every allowance for troops and immigration from the Punjab, the number of Punjabi-speaking people cannot be really large, appear to show that that language has been very often returned instead of the more

Lahnda is almost entirely confined to the Indus Valley and its dialects are further much localised. Thus Awankari, Dhanni, Ghebi, and Pothwari are only returned in appreciable numbers from Rawapindi. Hindki is essentially the speech of Hazara, where it is spoken by 76 per cent of the population, Peshawar only returning 3,865, Kohat 3,021, and Bannu 2,509. As in the case of Pashtu, however, there is a strong overflow cis-Indus, Rawapindi returning 132,152, [all but 1,718 in Attock Tahsil), and Mianwali 91,252. Jatki would seem to be confined to the Jat population of Dera Ghazi Khan, which stands in much the same relation to the dominant Biloch as the Hindki-speaking races do to the Pathan tribes. In this District it is spoken by 220,761 or 47 per cent. of the population. Derawal is returned as the speech not merely of the towns of Dera Ismail Khan, but of 143,347 or 57 per cent. of the population of the District. It also extends into Dera Ghazi Khan where it is spoken by 186,677 or 40 per cent., and into Tahsils Bhakkar and Leiah of Mianwali, where it is spoken by 165,326 or 46 per cent., of the District population. Chinawar, the dialect on the border between Lahnda and Punjabi, is only returned by 165 people. The colonization of its jurisdiction by people from the east and north will probably soon cause its complete disappearance. Thalochhri or the Thal patois is in the same position. Ubhe-di-boli or 'the speech of the East' is undoubtedly the Ubheji or Ubhechi ('eastern') of Shikarpur. It is returned by 1,922 persons in Multan.

servile Hindki.

^{*} Dr. Juke's estimate was from three to five millions.

In 1891 Jatki with its kindred dialects was returned as spoken by only 1,899,922 souls, but the figures were clearly imperfect—as indeed they still are. The apparent increase is thus over 1,300,000, but any detailed comparison would be useless, as the Hindi of Hazara, Rawalpindi, etc., was included in Punjabi and so on, in the figures of 1891.

The dialects of Lahnda.—The above is Dr. Grierson's classification. Dr. Jukes, in the preface to his Western Punjabi Dictionary suggests a somewhat different classification, in the following interesting passage:—

- "The Western Punjabi or Jatki language has many local names applied to it, Multani, Derawal, Jagdalli, Shahpuri Banuchi, Peshawari, Pothohari, Hazari, Bahawalpuri aral names of dialects of the language, which is spoken by the Jafir Pathans and Khetrans on the west of the Dera Ghazi Khan District to Bahawalpur on the East, and from Sindh in the South to the confines of Kashmir in the North, covering an area about the size of Ireland and with a population variously estimated at from three to five millions; the latter is probably near if not under the actual number. There seem to be three well defined dialects:—
 - Southern Punjabi, including Multani, Derawal, Bahawalpuri spoken from Sindh to the Dera Ismail Khan District.
 - (2) The Salt Range Dialects, called in Bhai Maya Singh's Dictionary Pothohari, spoken in Rawalpindi, Jhelum, Shahpur, Gujrat and the Salt Range:
 - (3) The Hazara Dialect.

Each District seems to have its own local name for the language, which has dialectical differences of pronunciation, meaning or idiom varying more or less every few miles, or even in different quarters of the same City."

Dr. Jukes further points out that there is probably considerable difference in the language as spoken by Hindus from that used by Muhammadans, the former being much richer in words having a Prakrit origin. Again Mr. Wilson writes thus:—

Grammar and Dictionary of Western Punjabi, Preface, page 1.

"The dialects spoken in the Shahpur District may be further classed into two groups, (a) the dialects of the plains and (b) those of the Salt Range. The principal differences between these groups are that in the Salt Range (alalects (I) many nouns in the oblique singular add an e or i to the root, e.g., plare (house), majhii (buffalo—cow); (2) the gentitive post position (of) is no instead of da; (3) several other post positions are different, e.g., ha or ah for nu (to), thao for thu (from); (4) the ending of the present participle is na instead of da; (5) a number of common words are different, e.g., thi for ho (become), ghinn for le (take), jub for chal (move), hag for sak (be able); (6) there is a stronger tendency towards nasalization of vowels; (7) and a tendency to substitute r for n, e.g., kar for kin (who), itră for itnă. These characteristics are also found in the dialect spoken in the western tahsils of the Rawalpindi District as far north as Attock, and probably in the intervening tahsils of the Bhelam District."

And he further adds :-

"The dialects spoken in the plains portion of the District may be further sub-divided into those spoken between the rivers Jhelum and Chenab, in what is called the Doab, and those spoken west of the Jhelam in the sandy desert called the Thal. The chief differences are that in the Thal, '1) hard d is often substituted for soft d, eg., in dddd (grand father) de (give), ddb (ten), idde (hither); (2) hard d is also substituted for other letters, eg., mdds for mêrâ (my); dêkh for vêkh (see); (3) the present participle ending in transitive verbs is often ândâ or indô instead ol-èindê; (4) a number of common words are different, e.g., beâ for hôr fother), dâhri for mard (man), saî for sândai (woman), thôlâ for thôrâ (little) naddhô for nikra, (small) assá for assi (we), du for dôe."

The characteristics of the North-Western group.—It seems certain that the languages of this group are in a much less advanced stage than those of the western group, in that they retain, to a far greater extent, the old Sanskrit infectional system, with pronominal suffixes, a strong passive form in i, and a future in s. But the differences between the two groups go even deeper than inflectional forms, for Lahnda possesses the Pashto rum (ur), found as the final letter in all verbs in the infinitive, and a hard b, dj, d, and g, as in Sindhi, though these letters appear to be confined to the south-west of its jurisdiction. The differences in the various dialects of Lahnda have, however, not yet been worked out, and it is only possible to touch upon the characteristics of the north-western group as a whole. Of these the chief is the free use of pronominal suffixes with erbs, negatives, and also with nouns. Instances of this structure in Lahnda are

jata-m jora, literally—'was yoked by me the pair,' or 'I yoked the pair': 'changa lagd-im,' 'does it become me?': 'kharu-m,' 'I (was) standing'; etc. The main point of interest about these enclitics is that they are found in many Aryan languages, both ancient and modern, as well as in the Semitic languages. They appear in Pashto, Balochi and in Sindhi, Lahnda and Kashmiri, but not in certain languages connected with Kashmiri. They do not appear in the Dravidian languages, but are common in Santali; and they are common in the Aryan languages of the East and South of India.*

The history of the North-Western Group.—It is extremely interesting, as bearing upon the ethnology and religions of the peoples of the West and South-West Punjab, that Dr. Grierson thinks it probable that, as far as the Punjab is concerned, the speakers of the North-Western group represent the first Aryan invaders of India, who were thrust back upon the Jhelum and Indus by a later set of invaders now represented by the speakers of Punjabi and Western Hindi, and he gives the following details in support of this view:—

'I think that there can be no doubt that Lahnda is not only a language distinct from Panjabi (that was admitted at the last Census), but belongs to a different group of Aryan languages. So intimately connected is it with Sindhi, that Siraiki, which is universally classed as a dialect of that language, is really a form of Lahnda. I have not worked this out yet in all its details, but I think you may be sure of the broad facts. On the other hand it merges, through Kohistani and Chibbali, into Kashmiri. It actually, at the present day uses words which were once used in Kashmiri, but have since died out. There are also, of course, many words common to the two languages at the present day.

I think it is probable that there were two Aryan invasions of India, one shortly after the other. The older invaders would in that case be represented by the speakers of Kashmiri, Sindhi, Marathi, which runs right across India, Oriya, Bengali, Bihari, and Assamese. The second invasion came in like a wedge, and settled about the Saraswati. They expanded and showed the older inhabitants west, east and south. They would be represented by the speakers of Panjabi, Gujrati, Rajasthani, and Western Hindi. So far as the Panjab is concerned, they expanded westwards, and thrust the older invaders back upon the Jhelum and the Indus. No doubt, in the process of going westwards, they adopted linguistic idioms from their opponents, on whose lands they settled. There are still traces of this in some of the Panjabi dialects.

ii. Western group.

to. The Western Group.—This group includes the principal language of the Punjab Province and corresponds to the Hindustani-Hindi, Bagri and the greater part of the Punjabi groups of the Census of 1891. It represents, in the two Provinces, 76 per cent. of the population, being spoken by 20,486,888 persons, of whom 15,550,061 are returned as speaking pure Punjabi.

There are four principal languages, Gujarati, Punjabi, Rajasthani and Western Hindi, in this group. Of these the first is represented by a few individuals, doubtless temporary immigrants. Its dialects, Malwi, Ahmadabadi, Kachhi and Kathiyawadi, are only spoken by 151 persons all told. The third, Rajasthani, is spoken by considerable numbers of immigrants from Rajputana who have in some cases been settled since a long period in the Punjab and are widely spread throughout it, while the second and fourth comprise the most important dialects of the Central and South-East Punjab.

11. Punjabi.—'Punjabi', writes Dr. Grierson, 'seems to have two dialects besides the standard of the Manjha, vis., Dogri and Malwai.' Under Dogri the returns show 22,510 (18,830 in Gurdaspur), but under Malwai and its subdialects, Hethi and Rath (in Jind), and Pachadi, only 119 persons in all are returned. Clearly these dialects have for the most part been returned as Punjabi.

As regards the characteristics of Malwai or Malwi, Dr. Grierson writes:-

"From a cursory inspection, I should be inclined to say that the distinctive feature of Malwi was the freer use of pronominal suffixes with verbs. Newton notes that fact in his Panjabi grammar. I see that on page 72 he gives these suffixes to standard Panjabi also, but my specimens appear to give it much more frequently to Malwi, more and more as we go west, and approach Lahnda. These suffixes are, I am certain, a relic of the time when a North-Western language, akin to the ancestor of the modern Lahnda, was spoken over the whole Panjab up to near the Saraswatt. The Aryan speakers of the upper Gangetic Doab subsequently overran the Panjab and partly imposed their language upon it. I think that the speakers of the North-Western dislate: entered the Panjab through the

Suffixes in the Kashmiri language by Dr. G. A. Grierson, C.I.E. in J. A. S. B. 1895, Part 1, pages 336—351.
 284

Kabul Valley, while the Gangetic Doab people possibly came in via Gilgit and Swat (leaving the aboriginals of Shina and Khowar behind them), and forced their way to the Saraswati, where they became the parents of modern Indian civilisation, and were surrounded for a long period by hostile Aryan tribes all of whom were connected with the North-Western immigration."

Jangli is returned by 74,072, of whom 64,610 are in the Chenab Colony and 8,276 in Multan, It is the dialect of the 'Janglis' or nomads of the Bar in Jhang, and Dr. Grierson classes it doubtfully as a form of Punjabi, and considers that it is simply a vague term which merely connotes a number of rude forms of Malwi. It is doomed to speedy extinction, surrounded as its speakers now are by the colonists.

12. Rajasthani.—Bagri (or Shekhawati), with Bikaneri, Jaipuri, Mewati, Merwari, Mewari, Marwari and a number of sub-dialects are classed by Dr. Grierson as dialects of Rajasthani, which has two great divisions, a Western, of which Marwari is the type, and an Eastern, whose type is Merwari, but the dialects have not yet been assigned to these two divisions. The Bagri is widely spread, being spoken by the numerous tribes which have immigrated into the south-east Punjab from the Bagar country of Bikaner, and is returned in Ferozepur (63,337 or 66 per cent.), in Patiala (5,779), as well as in Hissar (183,207 or 23 per cent.), Loharu (14,908 or nearly 98 per cent.), and Dadri (7,098), of their populations.

Bikaneri is only returned by 6,028 persons in all, and these are scattered over a number of Districts. It is only found in any numbers in Multan (2,358) and the Chenab Colony (1,040) being clearly confined to the immigrants from

Marwari is returned by 190,275, and the figures probably include other dialects of Rajasthani, such as Mewari or Jaipuri, for, as Dr. Grierson points out, Marwari is used by the people of other parts of India for all the dialects of Rajputana generally. In this sense it has indisputably been used in Patiala which returns 137,919, and possibly in Bahawalpur, (31,187). In Hissar (7,426), Delhi (4,171) and Amritsar (1,203), it has probably been more accurately used.

Mewati, or the speech of Mewat, the Meos' country, is virtually confined to Gurgaon, which returns 102,279 (or nearly 14 per cent. of its population), out of a total of 102,794 souls.

Gujari is also classed, provisionally, by Dr. Grierson as a dialect of Rajasthani, being closely akin to Mewari. It has a remarkable geographical distribution:—

Hazara returning 52,965 (or 9.4 per cent. of the District population).

Rawalpindi ,, 3,495

Chamba 1,126 (and Gurdaspur 467).

Hoshiarpur ,, 17,233 (or 1.7 per cent. of the District population).

13. Western Hindi.—The most important dialect of Hindi in the Punjab is the 'lariani, Bangru or Deswali spoken by 604,024 souls, probably in the main Deswal Jats and their dependent tribes. It is the main language of Hissar, (401, 704 or 51 per cent. of its population), and of the Dadri pargana of Jind, (200,512 or 71'1 per cent. of the population of the State).

The closely connected Ahirwati or Ahirs' speech is probably only a tribal sub-dialect of Deswali, being found in the same tracts, 1,147 speaking it in Hissar, and 6,362 in Dadri, out of 7,615 all told.

Hindi is returned by 13,380 persons, of whom 13,354 are in Delhi. Braj Bhasha is more scattered, being doubtless the speech of immigrants from the North-West Provinces, but 2,601 return it in Gurgaon out of a total of 3,551 in the two Provinces.

Purbi is probably used vaguely in the Punjab for all the forms of Hindi spoken to the east of the Jumna and the numbers returned under it (44,034), doubtless include many who speak Western Hindi. Dr. Grierson classes Hindustani, and Urdu, its Mohammadan literary form and the language of the Moghal Court, under Western Hindi. As the lingua franca of Northern and Central India it is widely diffused, being returned under one name or the other in every District and State, though the distinction between Hindustani and Urdu has certainly not been observed. In the Districts of the Delhi Division it has clearly been returned extensively instead of Hindi, and in Nabha in lieu of Punjabi.

(iv.) The northern

14. Pahari.—This group, represented in this Province by the Pahari of the Eastern Punjab, was retained by Dr. Grierson, pending the completion of the survey, in deference to former custom, though with doubts as to whether it really exists as an independent set of languages. It is certain, he says, that some, at least, of its members are closely connected both in form and by history with Rajasthani, thus confirming what legendary history tells us of the conquest of the Himalayan Area by invaders from Rajputana. On the other hand Dr. Grierson writes with reference to the late Mr. E. O'Brien's Notes on the Kangri dialect:—

"The Kangra dialect is an interesting one. It has much more of a Panjabi air than the Pahari one that I expected.

The suffix j of the dative-accusative is a missing form for which I have been hunting for some time. All these Accusative dative suffixes are really locatives of genitive suffixes. The Hindustani δb is a locative of δa (of course I cannot explain the whole process here), and similarly Kangri j b is a locative of a lost genitive j a, which latter is the same as the Sindhi j b (here the b is the sign of the nominative not of the locative). That it is originally a locative is beautifully shown by the locatives of the personal pronouns (tij b vich, δc , J vich is of course a worn out form of a locative $vich b_i$, in the middle, and the phrase means 'in the middle of you'. Here tij b is an adjective in the locative agreeing with vichb. It is not an oblique genitive which would be regularly tij b (cf. $d \bar{a}_i d \bar{c}_i$).

In the Punjab Himalayas the dialects are exceedingly numerous and probably every main valley has its sub-dialect differing slightly, but perceptibly, from those of the adjacent valleys. The Hill people emigrate but little, their clans are very local and are divided into small exogamous septs so that marriage at a distance is rare, except amongst the ruling families.

Dr. Grierson gives the following list :--

Serial No.	Language.	Dialect.		Locality.	Census, 1901.

To these must however be added :-

Theogi Rampuri	***	Theog St	of Siraji	spoken in	the Bashah	r State,	357-
		whose o	apital is	Rampur	110	***	790.
Kami	***	Jubbal	***	***	***	***	6.
Pachhmi	***	Sirmaur	***	***	***	***	1,122

E.g. mhara, 'our, ours,' reproduces the mhare 'our,' of Macwari.
 286

One or two notes on the names in the above list may be of interest. Bishshaa or 'the twenty hundreds', is a tract in the Jubbal State, probably so-called as containing that number of revenue-paying units. Giri-pāri simply means 'the dialect of the country across the Giri 'par, beyond), a part of Sirmaur which is ethnologically very distinct from the cis-Giri country. Giri-pāri is probably a true dialect. Of the four last names in the list, Theogi should be included in Keonthali, Theog being a feudatory of Keonthal. Pachhmi is the term used in Sirmaur for the Kangra dialects, as Kami is used of those spoken in Jubbal.

It is hardly necessary to say much regarding the distribution of these dialists, as the names indicate the country in which each is used. Chaurahi is confined to Chamba. Gadi (Barmauri) to Chamba and the Dhaola Dhar in Kangra. Bhadarwahi is the dialect of Bhadarwahi in Kashmir close to the Chamba border and Pangwali is the dialect of Pangi, which adjoins British Lahul.

Pahari hardly extends beyond the Rawalpindi border on the west, and the 13,465 returned for that District and the 35 in Hazara are doubtless the people who speak the various sub-dialects of the Murree Gullies. The Pahari of Peshawar (212) is probably Gujari or Tirahi. The numbers now returned for Pahari and all its dialects are 1,554,367, or only 31,204 more than in 1891. The population of the Hills is stationary and the Hill dialects must inevitably disappear as education slowly progresses.

- 15. The Eastern group.—The Eastern group is only represented in (tit) Eastern group. these Provinces by 2,558 persons who speak Bengali—a yearly decreasing community,—and possibly by a few of those who are returned as speaking Purbi, which is the West Indian name for Bhojpuri, especially for that form of it which is spoken in the east of the North-West Provinces.
- 16. Tibeto-Burman Family; Himalayan group,—I have nothing to add to paragraph 237 of Mr. Maclagan's report, except to note that some details regarding the remarkable dialects of Kanawari and Kanaishi, (the latter spoken in the Malana Valley of Kulu) will be found in Mr. A. H. Diack's Kulu Dialect of Hindi, 1806.
- 17. The Multiplicity of dialects.—It would be useless to attempt to define the term 'dialects,' but using it in a wide sense the diversity of dialectical variations is very striking.

As in the case of the written character so with the spoken languages a great number of local varieties will be found to exist, and each language will be seen to be divided into numerous dialects, sub-dialects or patois, between which no hard and fast line can possibly be drawn, though the differences, slight as they may be, are real enough. To the people themselves this diversity is apparent, or they say that the boli, a term including everything from accent to language, changes every twelve cos in the plains and in the hills every six.

But in addition to the local variations, we shall find, as with the caste-scripts, tribal dialects and trade-argots, which introduce cross-divisions and render any classification difficult.

18. Sacred dialects.—How far the language of the Granths should be considered a sacred dialect 1 am unable to say. It probably preserves, for the sacred books, an archaic form of the language, just as Hebrew was preserved long after Aramaic had become the speech of the Jews. The Sikh Nihangs have, however, "a distinct and curious dialect of their own, and use the masculine gender for everything," but perhaps the Nihangs' speech is, like the Quakers', not a true dialect. The influence of religion on language is nevertheless considerable, as Dr. Jukes has pointed out is the case in the south-west of the Punjab. Within the same tract of country we find the language of the people strongly affected by the language of their sacred books. This difference is well brought out in the following translations of the first verse of St. John's Gospel:—

Musalman Punjabi:—Mudhon Kalam si te Kalam Khuda de nal si te Kalam Khuda si.

Hindu Punjabi:—Ad vichch Subad si or Sabad Parmesur de sang si ate Sabad Parmesur si. 19. Trade argots.—Our information regarding the trade argots is not at all complete. Some of them appear to be true dialects. Thus Colonel Temple considers that the Naqqash, who are painters on papier maché in the Punjab and Kashmir and who have a distinct argot, have preserved a true dialect, the words of which 'represent either real existing words, or older, and in some cases obsolete, forms of them,' though it 'undoubtedly contains slang distortions and perversions of common words purposely made.'t

The Delhi Dalals; have a much less respectable argot, as it is used solely

for purposes of cheating

20. The Qasais' dialect .- The Punjabi Qasais who do not kill cows have a secret dialect, and it is an interesting question how far their dialect differs from that of the Hindustani Qasais on the one hand and those who slaughter kine on the other.

These latter, who are called Bhakkar-Qasai, (from bhakkar, a bull, cow,

(1. Akel.)
(2. Saur.)
(3. Tale) from Arabic salas, pronounced thialath.
4. Ruba or arba, from Arabic arba.
5. Khammas from Arabic khams.
6. This.

7. Haft, Persian. 30. Bodi,

or buffalo), to distinguish them from the Sikkhu or Mekn-Sikkhu (from mekni, a goat), use an argot which contains words of Persian and Arabic origin, as, for example, certain numerals, as the marginal 20. Bodi. examples show. Some of the words are common to this and the Chuhras' argot, e.g., gaimb thief, and gaimbi, theft, cf:

Chuhra gaimi, and Persian gum, loss. These trade argots appear to be allied to the true dialects of the caste-less tribes on the one hand and to the artificial secret argots of the criminal classes

21. The Sansis' dialect .- 'The Sansi dialect,' writes Mr. F. G. Bailey. ' may be sub-divided into two, the main dialect and the criminal variation. The former is used by all Sansis in ordinary conversation. It closely resembles Punjabi, though it is sometimes more like Urdu. The criminal variation is absolutely unintelligible except to the initiated.'

22. Tribal dialects.—It will be noticed that some dialects derive their names directly from those of tribes. Thus the Khattri dialect is literally the speech of the Khattars, a Rawalpindi tribe, while Ghebi appears to take its name from Gheb, a designation which survives in Bala Gheb and kindi Gheb, once the territory of the Ghebas, who now call themselves Rewals of Moghal Their chief village is Jandal which gives its name to the Jandali dialect. Ghebi is, however, no longer exclusively the speech of the Gheba tribe, whose numbers are only 208, whereas the Ghebi dialect is spoken by 74,082 souls. Jandali too is clearly not confined to Jandal, for it is returned by 39,016 persons and appears to be widely spoken in Tahsil Fateh Jang.

Gadi is another instance, being the dialect of the Gaddis or possibly of their country, Gadderan. Gujari is confined to the Gujars as a caste, and the gipsy dialects Odki, Labhanki, Kanjari, Baori and Sansia are only spoken by those tribes. The Wirkan-di-boli or Wirks, speech of the Linguistic Survey, has not been returned in the Census. In other cases the name of the dialect and of the tribal territory is one and the same. Awankari, for instance, is the 'Awan country' both in the Salt Range and in the Jullundur District. Ahirwa-i appears to be the name of the 'Ahir country' also, though it is primarily used of the tribe's dialect. Jatu is a curious instance. It is not, I believe, the dialect of the Jatu Rajputs. Its derivation is unknown to me.

In the third place, we find certain tribal or racial names and dialect names derived from the same source. Dogri, for example, is undoubtedly derived from dugar des, the low country under the Jammu Hills, as probably is Dogra.

But the latter term is commonly confined to the Rajputs of that tract, while Dogri is the dialect of the whole population. Again, Bagri and Deswali are dialects of the Pagar and Des tracts, but it would not, I think, be correct to say that the Bagri was the tongue of the Bagri Jats or Deswali that of the Deswal Jats. The names of the dialect and of the group of tribes have a common origin, but the group has been broken up and dispersed, so that its limits no longer correspond with those of its former dialect. Rath is not now, if it ever was, the dialect of the tract round Rewari which bears its name.

[†] For a full account of the dialect see Captain R. C. Temple's Trade Dialect of the Naggash, J A.S.B., 1884,

^{\$} See the Delhi Dalals and their Slang by the same writer. Indian Ant., 1884, pages 155-9.

CHAPTER VII.

INFIRMITIES.

I. Comparison with the returns of 1881 and 1891 .- The instructions for the enumeration of the afflicted were precisely the same as in 1891 and 1881. Divergences cannot therefore be attributed to alterations in the system of record. As in the case of literacy, no attempt could possibly be made in a Census to ascertain the degree of insanity or leprosy, and the figures for these infirmities are probably less accurate than those for deaf-mutism and blindness, but a precisely similar remark would, if correct, apply to the Census figures of 1881 and 1891.

The total population of the afflicted amounted in 1901 to 113,134 as against

				1901.	1891.	1881.

1, the decrease under each mity having been conous, except in the case of nity or, in other words, creas in 1881 72 persons very 10,000 were returned afflicted, in the present sus only 42 were so returned.

Assuming, as we are fully justified in doing, that these figures, which show a less sudden drop than did those for 1891, are substantially accurate, it remains to discuss the questions whether the improvement in the health of the population is real, or whether in the past decade the weakest have gone to the wall during periods of scarcity deepening into famine. This can best be done under each infirmity. One remark may, however, be made on the figures as a whole. Mr. Maclagan in writing paragraphs 189, 194, and 201 of his Report, appears to have been somewhat apprehensive that the decrease in infirmities since 1881 was more apparent than real. The regularity of the decrease, however, in the two last decades would appear to point to the very great accuracy of our statistics. If there have been errors, they have been remarkably systematic, and it is safer to assume that the results are correct than to attribute the decreases to improved defects in the record.

2. Insanity.—The startling decrease of 33 per cent. in the 1881-91 decade has been replaced by an almost equally startling increase of 24'6 per cent., and it is remarkable that females show a greater increase (27 per cent.) than males (23 per cent.). The increase is fairly general throughout the Punjab, excluding the Native States which show

			1501.	1891.	1881.	a collective decrease of

llective decrease of 250 ns. The North-West ier Province figures are t the same as in 1891. ncreases are most marked Districts shown in the n, and in all these Disexcept Kangra and

The only asylum in the Province is now the ore at Lahore, that at Delhi having been closed in 1900 and all its patients transferred to the former place. This accounts for the large number of insane returned by that District (889), the population of the Asylum on the 31st December 1901 having been 379. Looking to the continued and accelerated decrease in the number of deaf-mutes since 1881, it is not easy to think that many persons really insane have been returned under that head. Moreover, if many deaf-mutes had been returned as insane, we should expect to find a corresponding diminution in the number of deafmutes in the areas which return the largest numbers of insane. This, however, is not the case.

Criminal Lunatics .- The Jail population on the last day of February 1901 included only 13 criminal lunatics throughout the Province, but those suffering from insanity in an acute form are transferred to the Provincial Lunatic Asylum at Lahore. Of 131 lunatics admitted to the Asylum in 1900, only 34 were classed as criminal, and of the total number of lunatics treated, only 93 were so classed. The number of criminal lunatics is thus well under 5 per million of the population.

3. Insanity by occupation and religion.—With the sanction of the Punjab Government infirmities were not tabulated by caste, and it is not easy to see what value can attach to figures of insanity by caste in a Province where probably not one case in ten is medically diagnosed, and where the line between deaf-mutism and insanity is so uncertain.

Taking, however, the figures given in the Annual Reports on Lunatic Asylums in the Punjab, we find that the agricultural classes supply most of the inmates, though probably not an undue proportion of the total in proportion to their numbers. Fagirs supply a large number because in the nature of things lunatics, who are popularly regarded as semi-sacred, turn fagir and live by mendicancy.

Admissions into Lunatic Asylums classified by occupation.

			-					Clerk,						

For the purpose of comparing the respective liability to insanity of the violus occupations these figures are vitiated by the fact that one class is much more likely to send its lunatics to the Asylums than another: every insane sepoy for example is probably sent there, while among the professional classes the insane would most probably be looked after by their own relations. Again the insane of the towns are more likely to be swept into the Asylums than those of the villages.

Admissions to Lunatic Asylums according to religious.

			Н	INDUS.		AMMA-		TIVE STIANS,

	Total	***	402	73	339	64	4	9

The figures for each religion are also given in the margin, Hindus being classed as Sikhs. All that can be said as to these figures is that they go to show that religion is not among the causes which affect the liability to insanity.

4. Deaf-mutism .- The figures purport, as in previous censuses, to represent

	Ages.			Number.	Number per 10,000.
0-10				3.714	1.728
10-20	***	***	***	5,628	2,619

40 - 50	***	***	***	2.099	977
50-60	***	***	***	1 216	977 566
60-	***	***	***	1,598	743

congenital deaf-mutism. Their value may be gauged from the marginal figures for the decennial age-periods. The deficiency under the o—to period is, as Mr. Maclagan pointed out, obviously due to the impossibility of saying that a child is a deaf-mute until it has reached the age of two or perhaps even three

years. It may be indeed assumed that parents do not always give up the hope that inability to articulate will disappear for the first four or five years of life. The decrease of 9'5 (not 5'9 as misprinted in the report for 1891) in the number of deaf-mutes between 1881 and 1891 has been followed by a further decrease of nearly 12 per cent., and now less than 8 persons in every 10,000 are deaf-mute as against 10 in 1891 and 12 in 1881.

The numbers of deaf-mutes returned are large in Kangra (3,165), Hoshiar-pur (953), Rawalpindi (1,222), and Multan (935).

5. Blindness.—As in 1891 the figures include only those totally blind, and they are almost certainly the most accurate of the infirmity statistics, being based on a simple rule which could hardly have been misunderstood. This being so, the continued decrease of over 8 per cent. following on a decrease of over 6 per cent. in the actual numbers returned is perhaps the most satisfactory feature of these returns. Taking into consideration the increase in the population since 1881, the proportionate decrease is of course very much greater, and whereas in 1881 1 person in every 196 was returned as blind, only 1 in 343 is now so returned.

The Census of 1868 gave an even greater proportion than that of 1881 that the record is one of uninterrupted improvement. Allowing for the possibility that in the earlier censuses persons not totally blind were entered—a possibility which is I think hardly a probability, because native usage has distinct terms for blind (Hafiz, Surdas, or Surma Singh), *and for one-eyed (*Aana)—the progress has been remarkable.

No data are available as to the causes of blindness Small-pox is known,

60-	***	31,855

ss Small-pox is known, however, to be a frequent cause, but deaths from that disease appear to have been more numerous in the past decade than in 1881-91, having risen in 1896 to the abnormally high figure of 45,084 (including 39,257 children under 12) in British Districts alone. Looking to these figures one would expect to find a corresponding increase, of some

extent, of blind persons amongst the young born prior to that year, but the tables show no such increase. On the contrary, the marginal figures show that blindness is essentially an infirmity of old age.

Out of 100 blind persons 40 are aged 60 or more, and 55 are over 50, prior to which age the numbers are small, increasing but slowly from the earlier ages until middle age is passed.

6. Leprosy.—As in former censuses the rules provided against the inclusion of leucoderna in the returns and the figures may be taken as substantially accurate. The number of lepers had in 1891 decreased by 36 per cent. on the returns of 1881, which again had shown a marked decrease on the figures of 1868. The present figures show a further decrease of nearly 20 per cent., and the number of persons now returned is only 18 in every 100,000 as against 43 in 1881. The figures in

LEPROSY BY AGE.

			1	5.036	6,97

the margin are somewhat striking. They indicate that not only has the number of lepers decreased but that this improvement is very marked in all the ageperiods except those at the extremes. Unhappily the children under 10 show a slight increase, but the decreased numbers in the 10—40 periods is most

marked. It would be hazardous perhaps to conjecture that leprosy is on the verge of disappearance, but it seems permissible to hope that the next ten years will show a considerable decrease in the number of sufferers.

^{*} Hafash, according to Burton, (Arabias Nights, Volume 6, page 193) means the third order of traditionize out of fire i.e., one who known concocustations and their sextepliones. Problemly it is used for 'one who has learnt the Ooran by rote.' Surdas was a famous blind Hinds devote, merician and poet. A blind man is called Surdas by Hinds out of respect, and because the blindar supposed to be good musicians. Surma Singh is the name used by Siths, and Surma; is said to mean 'brave.' Sir Ri; hard Temple says Surdas "Serrast of Krishaa, (Proper Names of Penjiblis, page 25).

Note.—The difference in columns 2 and 3 is due to the fact that the former represents the number of ferrales suffering from infirmities, and the latter the number of infirmities from which they are suffering, e.g., if a female is suffering from both insanity and deal-mutism, in the former column sky is shown once but in the latter twice.

299

CHAPTER VIII.

CASTE, TRIBE AND RACE.

- 1. Terminology.—Mr. Risley has now laid down the following definitions, among others, and they are reproduced here for facility of reference as the terms will be constantly used throughout this chapter:—
- No. 1. "Endogamy, or 'marrying in' is the custom which forbids the members of a particular social group to marry any one who is not a member of the group. An endogamous division, therefore, is a group within which its members must marry".

Endogamous divisions may be territorial or local, functional or occupational, sectarian as oscial. In the Panjab instances of all those four kinds will be found. Ethnic and linguistic endogamous divisions are not, apparently, found in these Provinces.

No. 2. "Exogamy, or 'marrying out,' is the custom which forbids the members of a particular social group, usually supposed to be descended from a common ancestor, or to be associated with a certain locality, to marry any one who is a member of the same group. An exogamous division therefore is a group outside of which its members must marry".

The following classes of exogamous divisions are found in these Provinces :-

- i. Totemistic, being the names of animals, plants, etc., such as Kukar, cock, Gidar jackal. A man of the Kukar division may not marry a woman of that division and so on.
- ii. Eponymous, the ancestor who gives his name to the group being either a Vedic saint (as with the Brahmans and the castes who imitate them), or a chief of comparatively modern date, as with the Rajputs and others.
- iii. Territorial, referring either to some very early settlement of a section, or to the birthplace of its founder.
- iv. Local, communal, or family sections of small size and comparatively recent origin.
- v. Titular, or nickname groups referring to some personal adventure of the founder of the sept, or to some office which he is supposed to have held.

Besides these we also find castes which have no sections of any kind, or, which comes to the same thing, have only one section and habitually marry within it, and simply reckon prohibited degrees in the English way.

- No. 3. "Hypergamy, or 'marrying up' is the custom which forbids a woman of a particular group to marry a man of a group lower than her own in social standing, and compels her to marry in a group equal or superior in rank. A hyperga. How it is a group forming part of a series governed by the foregoing rule. The men of the division can marry in it or below it; the women can marry in it, or above it.
- No. 4. A Tribe is a collection of families or groups of families bearing a common name which, as a rule, does not denote any specific occupation; claiming common descent from a mythical or historical ancestor, and sometimes from an animal; usually speaking the same language; and occupying, professing, or claiming to occupy a definite tract of country. A tribe is not necessarily endogamous.

A Sub-tribe is the smallest endogamous division of the tribe.

A Sept is the largest exogamous division of the tribe.

Divisions intermediate between the sub-tribe and sept may, where they exist, be called clans and sub-clans.

Among the Muhammadan races of Baluchistan and the North-West Frontier the criterion of tribal unity resides not in the law of marriage but in the obligations of blood-

* Isogamy is the term which has been used for the rule which compets marriage in a group of equal states. As a matter of fact hypergamous divisions always appear to allow marriage of women in a group of equal status as well as in a group of higher status.

300

revenge. Members of the various divisions internarry freely and new divisions are constantly being formed. When applying the terms tribe, sub-tribe, etc., to these people it must be borne in mind that they do not imply any restrictions upon intermarriage.

No. 5. A Caste is a collection of families or groups of families bearing a common name, which usually denotes, or is associated with, a specific occupation; claiming common descent from a mythical ancestor, human or divine; and professing to follow the same traditional calling. A caste is almost invariably endogamous, in the sense that a member of the large circle denoted by the common name may not marry outside that circle. But within that circle there are usually a number of smaller circles each of which is also endogamous. Thus it is not enough to say that a Brahman at the present day cannot marry any woman who is not a Brahman; his wife must not only be a Brahman, but she must also belong to the same endogamous division of the Brahman caste.

A Sub-Caste is the smallest endogamous division of the caste.

A Section is the largest exogamous division of the caste.

No. 6. Animism may be defined as the belief which traces everything in the world, from the greater natural phenomena to the various diseases and misfortunes which afflict mankind, to the action of numberless spiritual beings, among whom, on the theory which gives rise to the name, the souls of departed chiefs and ancestors occupy a prominent place.

2. Scope of the present enquiry.—The main object of the enquiries made at the recent Census was to pave the way for the Ethnographic Survey now in progress. With this object an attempt was made to arrange the various groups we have to deal with on some system which will command general acceptance, at any rate within the limits of these Provinces. The system proposed was a classification of the castes by social precedence as recognized by native public opinion at the present day, and it was anticipated that the results of the enquiry on this point would throw light upon a variety of social movements which at present escape notice, and that they would provide a sound statistical basis for the Ethnographic Survey. To this question of the classification of caste I shall return later, but I propose to first describe the organization of castes in these Provinces and to show that, in this part of India, the caste is not by any means a homogeneous unit, but rather a complex group of units of varying status.

The method of enquiry adopted was the circulation of a set of questions consus Circular No. 30, dated 4th December which were not quite adapted to the special conditions of these Provinces, and which therefore are not reproduced here. The information obtained was in consequence often incomplete, and it will require to be supplemented in the course of the Ethnographic Survey, but as far as it goes it throws a good deal of fresh light on the constitution of caste in these Provinces; and on those social movements which must be thoroughly understood in all their complexity if any success is to attend the efforts made from time to time to repress extravagant expenditure on weddings, and in other directions.

3. The principles of caste organization in the Punjab.—Amongst the Hindus, and to a limited extent amongst the castes converted from Hinduism to Islam, we find exogamous divisions, usually, but by no means invariably, termed gots in the vernacular. Generally speaking every caste consists of a number of these exogamous divisions, or 'sections,' according to the fifth definition (paragraph 1 supra).*

But further within the higher castes we find groups and sub-groups, which appear to have originally consisted each of a number of sections. How these groups came to be formed is matter for conjecture, for there is nothing but tradition and legend to inform us, but the status of each group doubtless depended on the comparative purity of its descent, its observance of social laws, such as the prohibition against widow re-marriage, and the degree of its proximity to the original home of the caste.

This must not be understood to mean that a section is always found in one caste only. Certain section names appear in two or more castes, but whether those sections were originally the same is a matter for investigation.

But status however acquired could be lost, diminished or improved. If a family violated the rules of the caste it was punished, in extreme cases, with expulsion from the caste, and for minor offences with loss of status within it. The punishment however was inflicted on the family, not on the whole of its section, so that in the course of time the sections became split up, having some families in the original group, while some had been promoted to higher and others degraded to lower groups. Excellent illustrations of the working of this system are afforded by the Khatris, and the Kangra Rajputs.

Of all social sins the one principally guarded against by the liability to loss of status within the caste was any violation of the law of hypergamy, which comples the family to give a daughter in marriage in a group superior, or at least equal, to it in rank. If a family gave a daughter to a lower group it fell to the status of that group. Thus status could only be maintained by giving daughters in marriage within a restricted circle, which became narrower and narrower towards the top. In other words the social position of a family very often depended on the smallness of the circle within which it would marry its daughters. These principles are common to all the four types of caste organization in the Punjab.

THE ORGANIZATION OF CASTE.

- 4. The four main types of caste organization.—The types of caste organization in the Punjab may be, tentatively, classed thus:
 - i. The Khatri.
 - ii. The Rajput.
 - iii. The Jat.
 - iv. The Bania.

In the Khatri and Rajput types we find an elaborate system of social groups, but the Khatri type differs from the Rajput in the scheme of its groups. The Jat is a democratic type, with no social grades as a rule. The Banias have territorial and social groups, but their primary groups appear to be sectarian, and I have therefore treated them as a distinct type.

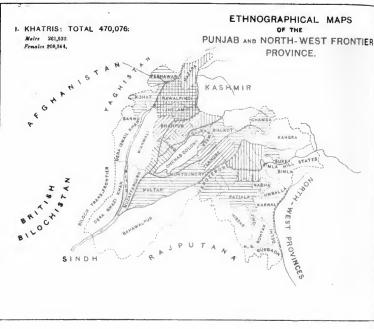

The Khatri organization is imitated with more or less fidelity by the Aroras, Bhatias, Tank Sunars and Nais, while the Khojas, converted Khatris and Aroras, still retain traces of their former organization. The Hindu Rajputs of Kangra stand alone, but the Rajputs in the rest of the Punjab, even when Mohammadanized, the Biloches and the Meos, are all organized on a principle somewhat similar to that found among the Kangra Rajputs. The Gujars closely resemble the Jats in their social system.

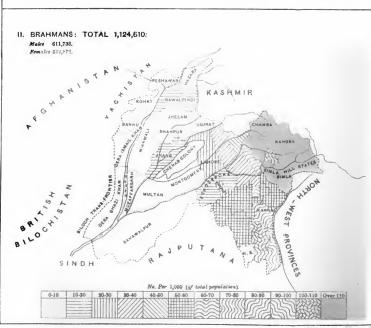

The Brahmans have an exceedingly complicated social system. Broadly speaking, those of the plains reflect the Khatri organization, and those of Kangra less distinctly follow the Rajput type.

I.—CASTES OF THE KHATRI TYPE.

5. The Khatris, Aroras and Bhatias.—The Khatris are essentially a trading caste, as are the Aroras and Bhatias, comparatively few being engaged in agriculture. The Khatris stand highest, many of them being bankers, and they are also largely employed in the civil administration. The distribution of these castes is illustrated by the maps, Nos. I, II and IV facing pages 303, and 308 in this chapter, and that of the Khatris is thus described by Mr. Ibbetson:—'Within the Punjab the distribution of the Khatri element is very well marked. It hardly appears east of Ludhiana. It is strongest in the central districts where Sikhism is most prevalent, and in Rawalpindi, Jhelum, Gujrat, Shahpur, and Hazara, and occupies an important position in the western Hill States. Although the Khatris are said to trace their origin to Multan, they are far less prominent in the southern districts of the western plains, and least of all on the actual frontier, but this would be explained if the Aroras be considered a branch of the Khatris.'

The Aroras hold the south-west, as the Banias do the south-east, of the Punjab, tracts in which the Khatris are hardly to be found. On the other hand, the Bhatia is found side by side with the Khatri in Sialkot, Gujrat and

Shahpur, and there is a strong Bhatia community in Multan. The connection between these three castes is obscure, and indeed it is doubtful whether the Bhatia has any ethnological connection with the Khatri or Arora. On the other Ethnology of India, quoted in Panjab Census hand, the Aroras were described by Sir Report, 1859, paragraph 309.

Khatris, and they themselves claim Khatri origin. The two castes indeed appear to overlap, for in Jhang the Magu and Katial sections who deem themselves Khatris, but are regarded as Aroras by the Lahoria Khatris, used it is said to give wives to the admitted Khatris of the northern Chenawan country—on the upper reaches of the Chenab—taking their wives from the Dakhanada Aroras further down the Indus valley. This is one of the numerous points which require further investigation in connection with the history of the Punjab castes. And in Bahawalpur Khatris generally take Arora wives, (but do not give daughters

The Khatris are, like the Aroras, mainly Hindus, but in both castes there is a Sikh element, small in numbers, but important in connection with the history of Sikhism. Properly speaking there are no Mohammadans in either caste, for a convert to Islam ceases to be a Khatri or Arora, and becomes, almost invariably, a Khoja. The Bhatias are strict Hindus, and it would be of interest to ascertain how they are organized in Sindh and Guzerat, whence they appear to have migrated to the Punjab.

to Aroras), though whether regular marriages occur or not does not appear.

I now proceed to describe each of these three castes in detail.

6.—The Khatris.—Organization.—The Khatris are divided into three main groups. viz:—

I. Bari. II. Bunjahi, and III. Sarin.—The Baris generally may take wives from the Bunjahis, but do not give them daughters in return. If a Bari family gives a daughter in marriage to a Bunjahi it loses status and becomes itself Bunjahi. The exact position of the Sarin is obscure. It is implied in more than one account sent to me that they are hypergamons, giving daughters to the Bunjahis. In Patiala they used to intermarry with that group, but infrequently, as such alliances were not approved. In Peshawar they claim that the Bunjahis used to give them daughters, which is hardly possible, for it is admitted on all hands that they are below the Bunjahis in status, and in Delhi they cannot even smoke with the two higher groups. Practically it may be said that they now form an endogamous sub-caste; (but there is one important exception, as noted in paragraph 8 infra).

Each of these three groups is further divided into sub-groups, as described below.

Group I.—Bari.—This group comprises twelve exogamous sections, and its name is undoubtedly derived from barah, 12.

These sections appear to rank thus :-

Sub-groups, (dhamas) :--Sections :-1. Kapur. 3. Malhotra or Mehra 4. Kakar, or Seth. Chopra.
 Talwar. i. Dhaighar. ii. Charghar. Sahgal.
 Dhawan or Dhaun. iii. Chheghar. iv. Báraghar or Bára-zati. or junior. 9. Wadhaun. 10. Tannan. 11. Bohra or Wohra. 12. Maindharu.

This group seems to be very generally recognised and there is usually no dispute as to the twelve sections comprised in it. But in Pindigheb 1 find Gandhoke, Bahi, Wahi and Soni given instead of Nos. 9 and 12 above, so that the Bari there have 14 sections.

The Bari group is apparently a close corporation into which no new sections could be admitted, though a family of any of its twelve sections may be degraded to a lower group. It contains four sub-groups based on the status of the families (not of the sections) in each. Thus the families of the Dhaighar sub-group are of the highest status and their status depends on the fact that they can only give their daughters in marriage in 'two and a half' (dhai') sections. Similarly the Charghar are below the Dhaighar in status because they can give a daughter in marriage to four (char) sections; and so on.

It follows from this that the families in each section are not all of the same status. For instance the Kapur section is mostly of Dhaighar status, but certain families having given daughters to the Sahgal section have fallen to Baraghar status, i.e., to the status of those who will give daughters to all twelve sections. Other families again have even fallen to Bunjahi status, by giving daughters in that group.

Group II.—Bunjahi.—This group comprises, theoretically, fifty-two sections, as the name bawanjahi, from bawanja '52,' would imply. The names and numbers of the sections are however variously stated, and it is clear that, all told, the number of sections in this group greatly exceeds 52. The sub-groups are variously given, but the typical grouping would seem to be as follows:—

Sub-group i.—Khokharan.—This group consisted of eight sections, originally, and hence it is also known as Ath-zatia or Ath-ghar, and these eight sections are, in Rawal-

Thama.		Section		Gotra.
1	***	Anand Basinh	***	***
2	***	Chadha Sahni	***	Virbans. Surajbansi.
3	***	Suri Sethi	***	
4	***	Koli Saharwal	***	***

(Nos. 1, 3 and 4 are Chandr-bansi.)

sections are, in Rawaipindi, divided into four
thamas as grouped in the
margin. Of these the first
three form exogamous
divisions, intermariage
being forbidden between
the two sections in each
thama because they belong to the same Brahmanical gotra. To these
eight sections the Chandiok have been affiliated in

Peshawar, and in Patiala the Kannan section is said to belong to this group.

The Khokharan were originally an off-shoot of the Bunjahis, and I have therefore classed them in this group, but, though they are said in one locality to still take wives from the other Bunjahis, they are as a rule endogamous and thus really form a sub-caste.

Bunjahi-khas or kalan,

Sub-group ii.—The Asli, Pakka (or 'real') or Bári-Bunjáhi, † comprising twelve sections.
Sub-group iii.—Bará or elder Bunjáhi, with 40 sections, called collectively Dharmán or Oharmain.

Sub-group iv. — Chhota or younger Bunjáhi, with over 100 sections. This sub-group is also called Ansar, or Sair, or Bunjáhi-Khurd or '-am.

Of the last three sub-groups the third used to give daughters to the second. The relations of the fourth, the Chhota Bunjáhi, to the second and third are not explicitly stated, but they also appear to be hypergamous.

Group III.—Sarin.—This group comprises a large number of sections, and the story goes that in 1216 A. D., the group was divided into twenty grades, each consisting of six sections, though, as a matter of fact, 123 sections are specified. At present there are two sub-groups:—

Sub-group i.-Bará, or elder Sarin.

Sub-group ii.-Chhotá or junior Sarin.

304

This explanation is advanced tentatively: for a further discussion of the meaning of these terms see the Appendix to this Chapter.

[†] The Bárl-Bunjáhi must not be confused with the Bári group above. The Bárl-Bunjáhi are a sub-group of the Bunjáhi,

The first sub-group comprises, according to one account, ten sections and according to another, thirteen, but of these thirteen the last two are unable to obtain wives from the other eleven sections, to which they give wives. The Chhota Sarin, comprising 108 sections, used to give daughters to the Bara sub-group, but the two sub-groups are now said not to intermarry. Generally speaking, the Sarin sections are distinct from those of the Bunjáhi and Bári groups, and it is unusual to find a section partly Bunjáhi and partly Sarin.

7. The territorial groups.—The territorial groups of the Khatris render it exceedingly difficult to give a clear account of their organization and for this reason I have excluded any allusion to them in the preceding paragraph. They must, however, be described and as far as possible explained, for they are constantly mentioned in the received accounts of the caste and, what is more important, have a place in its organization. They are indeed cross-divisions of the groups already described.

The most ancient territorial group appears to be the Uchhandi, or Khatris of the uplands, which may be taken to mean of the north-west Punjab. Other territorial groups are Multani, which was of high standing, Peshawaria, and Bharochi (of Bhera in Shahpur). None of these seem to be endogamous. The Lahoria and Sirhindia tintermarry on equal terms, though the former possesses an exalted status, so that "Dhaighar (Bári) Lahoria denotes the fine fleur of Khatriism.

In the Sialkot sub-montane there are two endogamous groups, the Jhikli, of the plains, and the Dugri, of the low hills, and in both of these the Bári and other social groups appear not to exist.

In the south-east of the Punjab there are two groups, the Dilwala ‡ (of Delhi), and Agrawala, to which may be added a third, the Purbia, (in the North-West Provinces). In the Agrawala the Bári group does not appear to exist but there are Dhaighar, Charghar, Chhezati and Khokharan groups, and below them the Bunjahi and Sarin groups, as in the central districts. Of these the Sarin and Khokharan are strictly endogamous, but the others are hypergamous. The territorial groups here are distinctly hypergamous, for the Agrawalas take wives from the Purbias and some Agrawala families take a pride in giving daughters to the Sirhindia and Lahoria groups; so too the Dilwalas used to give daughters to other groups, especially to the Agrawalas, though they are now said to be endogamous. These territorial groups however appear to be somewhat nebulous in character, for to the Khatris of the North-West Provinces all the Khatris of these Provinces are 'Punjabi,' and conversely to the Punjab Khatris those of the North-West Provinces are 'Purbia.'

i. Of Dhaighar and Charghar { 1. Seth. 3. Kapur. 2. Mehra. 4. Khanna. 4. Khanna. 5. Bahl. 6. Sahgal. 6. Chheani (i.e., of sis sections) { 6. Dhaun. 9. Talwar. 7. Chopra. 10. Purl. 11. Bahl. 4. Walu. 2. Berl. 5. Bij. 3. Sahgal. 5. Bij. 3. Sahgal. 5. Bij. 3. Sahgal. 5. Bij.

1, Seth 4. Tandan.
2. Mehra. 5. Kakkar.
3. Kapur. 6. Behra.

But the last section cannot obtain wives from the first five.

It would almost seem that the Sarin attempted or are attempting to form a Bári sub-group, with 12 sections at the top in imitation of the Bári Bunjáhi.

[†] Lahoria - of Lahore, 'and Sirhindia - of Sirhindi, 'i.e., of the country near Patials, etc. The two groups have nearly the same sections and intermary on equal terms, but they have different ceremonies at marriages. They are said, in an account of the Khatris written by Rai Babadur Piari Lai of Delhi, to be grouped thus -

at state the sections in the order given. It will be seen that Bailed Shippl over in the two latter groups will Berl in but an offshoot of Chopert. A Dhailphar cannot had been seen a nonce but a Dhailphar without being status, and becoming Charghar if, for example, he gives her to a Charghar. But he may take a wife from a Charghar of Chepsatio or Chepsatio or Chopsatio or Characteristic or Chopsatio or Characteristic or Chopsatio

[‡] Dilwala (Deihi-wala) comprises :-

L. Piari Lal also petes that the Dilwala have ceased to smoke with the other divisions of the caste.

8. The sacred sections of the Khatris.—There are four sacred sections among the Khatris, whose position must be touched upon. These are the:—

Bedi, of the Dharman-Bunjahi or Chhota-Sarin sub-group. Sodhi, of the Chhota Sarin sub-group.

Tihun Bhalla of the Bara-Sarin sub-group.

These four sections became sanctified by the births of the various Sikh Gurus to them. Thus the second Guru, Angad, was a Trihun, and strictly speaking his descendants are Bawa-Trihuns: the third Guru, Amr Das, was a Bhalla and his descendants are, similarly, Bawa-Bhallas: but in each case the section, as a whole, appears to have acquired a sacred character by the birth of the Guru within it, and it is not merely his descendants who possess that character. Nevertheless it is to be noticed that this inhetited sanctity has not altered the social status of these sections in the caste. The Sodhis* remain Sarin, but they internarry with the Bedis, whose status is generally said to be Bunjahi. Further the Bedi have actually in a few cases violated the rule of exogamy and permitted marriage within the got, it being apparently held a less evil to break that rule than to give a daughter in marriage to any but a member of a sacred section.

9. The rules of marriage.—Generally speaking, the Khatris avoid the usual four sections or gots, vis., those of the lather, mother, father's mother and mother's mother to but when the law of hypergamy narrows the circle of alliances, this rule has to give way. Thus the Dhaighar families of the Kapur, Khanna, Malhotra and Seth sections are not bound by this rule, and avoid only the father's got and the near relations of the mother. Further, the rule forbidding internariage between the descendants of a common ancestor is not invariably observed, for the first three of these sections are descended from three brothers, yet their descendants are closely intermarried. The Khokharan again avoid only the gots of the father and mother, because they have so few sections to marry into. The Baris appear to avoid both the parents' gots and the relations of their mothers within seven degrees, but no general rule can be laid down.

A common Brahmanical gotra is also said to be, as a rule, a bar to intermarriage, but though the Khanna and Kapur sections are both of the Kaushal gotra, they intermarry. Thus we have the unexpected result that the higher groups are the least bound by the ordinary rules which prohibit marriage within certain circles of relationship.

The ages of betrothal and marriage.—The age of the betrothal in the case of the Khatris depends on the status of the group. For example in Rawalpindi, where the Khatris are proportionately most numerous, the age of betrothal varies. It is stated to be from 4—8, for girls, among the Khokharan and Baris, and 8—10 among the Bunjahis. Marriage follows at 8—12 among the former and at 13—12 among the latter. There is no muklawa and married life commences at 13—15 in all the groups. In Gurgaon the Khatris, as a body, are said not to practise infant marriage.

10. The traditional origin of the groups.—A legendary history of the Khatri groups has been already given by Mr. Ibbetson and need not be repeated here. There are however other accounts, which vary in details, and of these the most circumstantial is as follows:—When Ala-ud-din Khilji attempted to impose the custom of widow re-marriage on the Khatris, those of the caste who lived at Delhi and Sirhind said they would abide by the decision of the Khatris of Lahore, who in turn referred the matter to the Khatris of Multan. It was thereupon determined to resist the Imperial edict, but the Khatris of the Bari Doab, of Ark and of Sirhind were afraid to adhere to this resolve, and in consequence they formed the Sarin group. On the other hand the 377 sections,

^{*}The Sodhi of Anandpur are the descendants of Suraj Mal, (not Surat Mal, as printed in paragraph 104 of the Penjab Cessus Report, 18(3), son of Gura Hargobind and are called the bare mel & Sodhi, as opposed to the chibate mel & Sodhi or Mina Sodhis (G/. paragraph of 32 Chapter III, page 136 supra).

called Uchandi, deputed 56 of their number to urge their cause at Delhi, and thus the remaining 321 sections became known as the Ansar or supporters. Of the 56 sections deputed to Delhi, 52 became the Bunjahi-Kalán or Khás (or senior Bunjahi), and four became Dhaighar. This latter sub-group was formed of the three eponymous sections, Khanna, Kapur and Mehra, whose ancestors, at the instigation of their mother, had headed the resistance to the imperial will. To these the Seth-Kakar were affiliated.

This explanation of the origin of the Dhaighar is hardly tenable because these sections are by no means exclusively Dhaighar. The legend does not attempt to explain the origin of the Bári group, or of the Charghar and other sub-groups. As to the term Sarin, the derivation from shará''ain, (because they adopted the shara' or Mohammadan Law), is often given, but the word is most probably a corruption of sreni, a line, or a guild of traders. Sreni is, Mr. Risley notes, a common term for sub-caste in Bengal.

II. The results of the Khatri social system.—The general principle underlying the Khatri organization appears to be perfectly clear, and is that the higher (and therefore in the nature of things the narrower) the circle within which a daughter may be given in marriage, the more exalted is the social position of the family in its own group. This principle finds full scope in the Bári group, within which the social status of a family may constantly change, while the section, as a whole, has no fixed status. In the two lower groups the sections appear to be more definitely allotted, as it were, to the various groups. This however is a very obscure point and I need not pursue it further here. It is sufficient to note that hypergamy leads to its usual results, though owing to the general complexity of the Khatri organization and to its endless local variations it is not possible to do more than state those results generally.

In the first place there is competition, in the lower groups, for sons-in-law, so that marriage expenses are, as the author of the Tawarikh-i-Qaum Khatrian says, ruinous among the Sarin, very heavy among the Bunjahis, heavy among the Baraghars, and very slight among the Dhaighars.

But this was not the only result. In 1852 Sir Herbert Edwardes, then Deputy Commissioner of Juliundur, described how the Lahoris used to make away with the girl-wives they obtained from the Bunjahis in order that they might obtain fresh brides and fresh dowries. The Báris, as a whole, are to this day in the same position, and however poor or distressed a Bári may be, he is sure of getting a wife with a handsome dower from a respectable Bunjahi family: (Patiala). If a Bunjahi wife died, when married to a Bári, it was callously said:—'purana chula, ghi jadid,' or 'if the hearth be cold, the ghi is fresh,' meaning that the dead wife could be easily replaced.

As might well be expected strenuous efforts have from time to time been made by the lower to shake off the social tyranny of the higher groups and these have met with some measure of success. The manœuvres of the various groups concerned are too complicated for description here, but it may be said that the results have been, in Gujrat, to sever all connection between the Báris and the Bári-Bunjahis, so that the latter are now apparently endogamous, while in Patiala and Jullundur the object seems to be to make the Baris reciprocate by giving wives to the Bunjahis, and this object is said to have been attained. Thus, generally speaking, the tendency is to revolt against the inequitable rule of hypergamy and transform the hypergamous groups into endogamous sub-castes.

12. Aroras.—The Arora caste is organised in a very similar way to the Khatis. Its primary divisions are the genealogical sections, as in all Hindu castes, but it has three or four territorial groups:—

1. Uttaradhi, or Northern.

2. Dakhan or-da, or Southern.

Sometimes classed as one group.

4. Sindhi, of Sindh.

Numbers 2 and 3 intermarry in some parts, but not in others. In Jhang they do not, but in Fazilka they are said to have begun to do so. The probability is that the Dakhana still take wives from the Dahra group, as they used to do.

The Uttaradhi sub-caste appears to be absolutely endogamous east of the Indus except in Bahawalpur where this group takes wives from the other three groups.

Trans-Indus Captain O'Brien notes a solitary case of a girl of the Jam section (Uttaradhi) being given to a Kumbhar (Dakhana).

The Uttaradhi alone seem, as a rule, to have the Bari-Bunjahi divisions. The Bari group consists of 12 sections, thus—

And of these numbers 1-7 intermarry, but will only take wives from numbers 8-12, and there is a further tendency on the part of numbers 1-5 to discontinue giving daughters to numbers 6 and 7. In the south-east of the Punjab the Bari and Bunjabi groups exist both among

Bari and Bunjahi groups exist both among the Northern and Southern Aroras,

There are a few sections, e.g., Suchdeo, Lund Bazaz and others, which are found in more than one of the territorial groups. The Sethe section may possibly be the same as the Seth or Sethi Section of the Khatris.

13. The Bhatias.—This caste has 84 sections divided into two groups thus—Group I.—Bari—

Both Balaha and Jawa claim to the Charghar. All these sections are of Baraghar status. It is hardly necessary to explain that Dhaigar may not give daughters to any but Dhaighar, though they may take from Charghar and so on. A breach of this rule involves degradation and hence the same section may be both Dhaighar and Charghar.

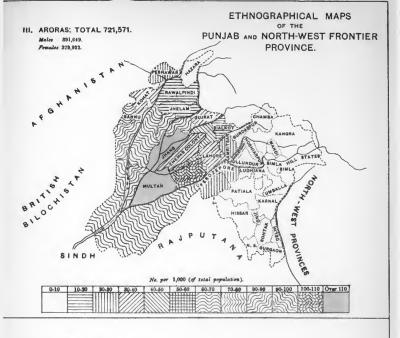

Group II .- Bunjahi, which comprises the remaining sections.*

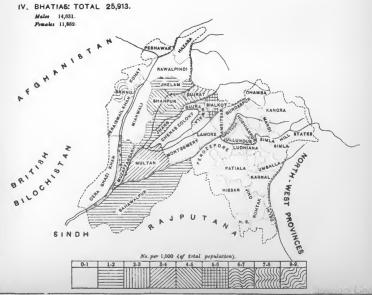

There are no territorial groups, but the orthodox idea among the old men is that daughters should be given to the Western Bhatias of Shahpur, Jhelum and Dera Ismail Khan as they are of superior status (to those in Gujrat), while the Eastern Bhatias of Sialkot and Gujranwalla are considered inferior and wives are taken from them (G. paragraph 76 of Chapter II supra).

Bhatia sections.
Sijwala.
Gandhi.
Chachra { Sip.
Wadoja.
Dhagga.
Babla.
Wanjak.
Ra-rakha.
Challhar.
Rilla.
Wattu.

It should however, be noted that in Bahawalpur (which returns only 837 Bhatias) these groups appear to be unknown, and the sections given in the margin are not grouped though the Sijwala is the highest and the Rilla the lowest. The Bhatias have a proverb 'dhan di wadi ai' or 'wealth is greatness.'

There is also a lower group called Gand, the offspring of Bhatias married to Arora women or of widow remarriages. The Pushkarna Brahman is their purchit.

14. The Sunars.—This caste has two main sub-castes, Mair and Tank, which appear to be strictly endogamous. The Mair claim to be Mair Rajputs, of Rajputana, who took to working as goldsmiths. In support of this claim the Mair and Tank Kshatriya Rajputs Shaik Sabha have furnished some particulars of interest. The Roda section is still ministered to by the Dhaumya Acharya, who cut off the ear of the horse at the Ashwa-medha of Yudhistra, and at the rit or charakaran ceremony the ear of a goat is still cut off by the family priest. The Masaun section, specially, worships Guga. Other Mair sections are Dhalla (flag-holder), Jaura (twin), Sinh (tiger), Babar (lion); Sur (hero) and many others—some 56 in all. Of these the Jaura claim kinship with the Chhina Jats and they exchange ajaran, or presents of food on certain occasions, at Thatta Chhina near Wazirabad. The Jaura Sinh and Sur sections all claim a common descent with the Randhava, Nijar and Sara Jats, and this is consistent with the claim to Rajput origin, for the Chhina, Karutana and Sara Jats are said to be origin Jadu-bansi Rajputs.

The Tank sub-caste.- This sub-caste is divided into two groups :-

Group IBari-		
 Ajimal, or Ajaimal. 	5. Samanial	9. Khich.
2. Ahat.	6. Pajji.	10. Hachar.
3. Gijjar or Gujar.	7. Teji.	11. Batru.
4 Thathre, or Thothre.	8. Salgotria.	Raltre.

Of these the Samanial appear to be extinct. Another account gives Kaun, Kokal, Katarmal and Gidar instead of numbers 11 and 12 of the above list (or 14 sections in all), but the three latter appear to be really Bunjahi.

Group II.—Bunjahi.—It is claimed for the Bari gots that they agree with the Bari sections of the Khatris, but it is admitted that only one of the names (Batni*) agrees. The Bari wear the janeo, at least before marriage, and some sections reverence the kite at the maunan or head-shaving ceremony like certain Khatri sections.

In Sialkot, however, the Bari group does not seem to be known and instead we have two groups—

```
| Sections. | Sections. | |
| I.—Dhaighar.— | 1. Dahir. | 3. Nagi. |
| II.—Bunjahi-Par.— | 2. Bhola. | 4. Ved. |
```

The Dhaighar, though descended from a common ancestor, usually intermarry, but they may take girls from the Bunjahi. Their ancestors, were three brothers of the Soni section of the Khatris, and they and the Soni still have a common Sati at Bhalan in Sialkot.

There are also sub-groups of the Bunjahi which are variously described-

```
Sub-group i Panj-zati—1. Bhopal.
2. Bhatti.
Sub-group ii Chhe-zati—1. Sauni.
2. Dhanda.
3. Botan.
4. Thanda.
3. Ajaji.
5. Sanjogi.
4. Ajarmula.
6. Mehra.
```

But another account omits Sauni.

In Dera Ismail Khan the Bunjahi are divided into sub-groups, thus-

```
      Sub-group i Khatri
      1. Sarna.
      4. Akasmula.
      6. Makhu.

      2. Dhanda.
      5. Kan.
      7. Nukra.

      3. Ajoti.
      8. Bhol.
```

And numbers 1.5 of these will not 'intermarry' with numbers 6-8.

```
Sub-group ii. Arora,—1. Batta.
2. Suchcha, 5. Batton.
3. Dhaneja.
7. Chandpul.
8. Taramina.
9. Lodar.
9 d Dakhna status.
```

And even this name does not appear as a Khatri section-name in the lists sent to me.

And numbers 1.6 of these will not ' inter-North Indian Notes and Queries, II, §167 (etc.). marry ' with numbers 7-9.

The sub-caste worship the snake as an emblem of the Nag or Takshak the founder of the Nag-bansi or Tank-bansi family and one of their sections is called Nagi.

- 15. The Nais.-The Nais or barbers, whose peculiarly intimate relatives with the higher castes lead them to closely imitate their social system, also have Chheghar, Dhaighar, Bari and Bunjahi divisions, of which the first three do not give daughters to the fourth (in Kalsia). This account is confirmed from Rawalpindi where, owing to the ceremonial connection of the barbers with the higher castes, hypergamy exists and depends on their status as barbers of high or low caste Khattis. These distinctions are, however, said to be new and not generally recognized.
- 16. The Khojas The Khojas of Jhang, who are mainly Khatris converted to Muhammadanism, have hitherto preserved their original Hindu classification into Bari and Bunjahi, but hypergamy is said not to exist. The converted Aroras are also termed Khojas and their sub-divisons used not to intermarry with those of Khatri origin, but such marriages now occasionally occur-On the other hand in Shahpur the Khojas have the following sub-divisions:-
 - 6. Rawar, or Ror. 1. Sahgal.
 - 2. Wohra, or Bohra.
 - 7. Matoli. 8. Goruwala. 3. Sethi.
 - o. Magu. 4. Kapur.
 - 5. Dugal. 10. Mahndru.

Of these the first six and the last three are Khatri section-names, and the last three cannot obtain wives from the other Khoja sub-divisions, but they give daughters to them. The Khojas of Leiah have the Khatri section-names of Kapur, Puri, Tindan and Gambhir. The sub-divisions are no longer exogamous, and as wives may also be taken from other castes, endogamy is no longer the rule. The term Khoia is, however, a very vague one, and the numbers returned as Khoias include many converts to Islam of other castes than the Khatri and Arora.

THE BRAHMANS.

See map at page 303.

17. The Sarsut Brahmans -The Brahmans are divided into ten great branches, five of which are called Dravida and are found to the south of the Vindhyas, while the other five, called the five Gaurs, are confined to the north of

Samswat or Sarsut.

Sarageway or Sarsut.
 Kanyakubja of Kanauj.
 Maithila, of Mathila.
 Utkala, of Orissa.

that range. Of these latter only the first two, the Gaur* and Sarsut, are, as a rule, found in these Provinces. The Gaur are however almost entirely confined to the south-west

Punjab, being parohits of the Banias and other castes which have immigrated from Rajputana or from the east of the Jumna into these Provinces. The Sarsut is essentially the Brahman of the Punjab, just as the Khatri is distinctively a Punjab caste.

The Sarsut, as a body, minister to all the Hindu castes, possibly even to those which are unclean and so stand outside the pale of Hinduism. Upon this fact is based the leading principle of their organization, which is that the status of each section of the Brahmans depends on the status of the caste to which it ministers. Thus, in accordance with this principle, we find the Brahmans of the Guirat District classified thus :-

> Group I .- Muhial. Group II .- Sarsut :-

1. Panch-zati. 4. Bunjahis. 2. Chhe zati. 5. Khokharan.† 3. Asth-bans. 6. Sarin. Sub-group i.-Brahmans of Khatris ...

Sub-group ii-Brahmans of Aroras.

Sub-group iii-Brahmans of Jats.

[•] In rare cases the Gaurs take Sarsut wives, when they cannot obtain wives of their own branch.

7 I think this is correct. The Muhial have ceased to be Brahmans at all and no longer minister to the Khokharan Khatris.

The Muhial Sarsut.

This classification is convenient and, I think, correct. It makes the Muhial a separate group, which is in accord with their own desire, for the Muhial now object to being described as Brahmans at all, because they no longer accept offerings, but take service or engage in other purely secular professions. Nevertheless their history illustrates the very principle which has been just stated, for the Muhial were parolits of the Khokharan-Khatris and when the latter became divided from the Bunjahi Khatris the Muhial followed their lead and became separated from the main body of the Brahmans. The separation was lowever

incomplete, for in Rawalpindi, where they are most numerous, five or seven Bunjahi sections continue to give them daughters in marriage, and I have therefore still classed the Muhial as Brahmans.

The Muhial comprise seven sections-

```
Families.
(1) Dat.
(2) Chhibar,
(3) Bali.
(4) Mohan.
(5) Ved.
(6) I.au.
(7) Bhimwal.
```

And of these the first five take daughters from the last two, but do not give them in return. Each Muhial section eats separately, and will not take food from the same dish as one of another class. In Rawalpindi the Dat are still further divided, the Kanjruri families being superior to the other two branches, and they endeavour to form alliances with the Bhanji, the superior branch of the Chihbars. So too in Gujrat there are families within the sections which claim a higher status.

The Sarsut Brahmans.

18. The Brahmans of Khatris.—The connection of the Khatri with the Sarut Brahman caste is peculiarly close. One tradition of its origin avers that, when Parasu Rama was exterminating the Kshatriyas, a pregnant woman of the caste took refuge with a Sarsut: When her child, a son, was born, the Sarsut invested him with the janeo and taught him the Vedas. Hence the Sarsuts are invariably the parchits of the Khatris and from this incident arose the custom which allows parchit and jujman to eat together.

The boy married 18 Kshatriya girls and his sons took the names of the various Rishis and thus founded the gotras of the Khatris, which are the same as those of the Brahmans. This legend explains many points in the organization of the Sarsut Brahmans in the Punjab, though it is doubtless entirely mythical, having been intended to account for the close dependence of the Brahmans of the Sarsut branch on the Khatri caste.

Group I, Panjzati I.—At the top of the social tree stand five sections,

1. Mobia
2 letii
3- letiight That This group Fanjasti, or Packhada.
4 Tikna
5- Kumaria
5 Romania
6 Romania I Group Panjasti, or Packhada.
5 Romania I Group Fanjasti, or Packhada.
6 The This This group is known as the Panjasti or "five sections," and also as Pachada or "western." If the Brahmans followed the Khatri organization in all its complexity we should expect to find

311

In Jhang there is a sub-group called Char-zaii:—
 Sections—(1) Dhanna-potra descended from Dhanna, a Dat.
 (2) Satpal, descended from Sidh Khakhar, a Chhibar.
 (3) Sidh potra, descended from Sidh-Bhol, a Ved.

⁽³⁾ Sum-ports, descended from Sidh-Sham, a Lau, and this group employs the daughter's son or busband, or the sister's busband in ceremonies, like the Dumna, etc., in Kangra. This sub-group do not call themselves. Whiled.

five sections constituting the Dhaighar sub-group of a Bári group, but though they are, it would seem, called Dhaighar-Lahoria, at least in Lahore, the Bári group does not seem to exist.

Group II—Bunjahi.—This group contains several sub-groups, whose relations to one another are obscure, and indeed the subject of controversy. They may be classified, tentatively, as follows:—

Sub-group i-Ashtbans, with the following eight sections :-

In Amritsar:	or in Karnal:	and in Patiala:
Sand.	I. Sand.	i. Sand.
2. Shori.	2. Patak.	2. Suri,
3. Patak.	 Joshi Mahrur. Joshi Malmai. 	3. Patak.
4. Mahrur.	4. Joshi Malmai.	4. Joshi Malmai.
5. Joshi. 6. Tiwari.	5. Tiwanj.	5. Joshi Mahrur.
б. Tiwari.	6. Kural.	6. Tiwari.
7. Kural.	Regne.	7. Kural.
8. Bhardwaji.		8. Rata Bhardwaj.

Sub-group ii: Bára-ghar or Bára-zati (also called Bári):-

1.	Sarad.	In Hazara—Vajra.
2.	Bhanot.	Vasdeo.
3.	Airi.	Paonde.
4.	Kalie.	Bhog.
5.	Parbhakka.	Ishar.
õ.	Nabh.	Ramdeo.
7.	Manan. Bhambi.	Sang.
8.	Bhambi.	Sudan.
9.	Lakhan Pal.	Majju.
10.	Patti.	Sem.
11.	Jalpat.	Dhammi.
12.	Sahjpal.	Tara.

. ...

The Zat-wale :-

Sub-group iii: Panj-sati II.—About 116 years ago the Brahmans of the five sections below used to give their daughters in marriage to the Dhaighar Lahorta Erahmans:—

(1) Kalie. (3) Kapurie. (2) Malie. (4) Bhaturie.

(5) Bagge.

When their daughters 'began to be treated harshly in the houses of their fathers-in-law, these Brahmans (panjeat or five sections) arranged to contract marriages only among themselves' and ceased to form relationships with the Dhaighar Lahoria.

Sub-group iv: Chhe-sat-wala.—Similarly several other sections of Brahmans gave up giving daughters to the Dhaighar Lahoria Brahmans, such as—

op Siring and Sinters to		2 1141	23.47.00	, and a rainfiding	36
	(1) (2) (3)	Pandit. Patak. Dhunde.	(4) (5) (6)	Gadhari. Dhan Kaji. Chhukari.§	
Sub-group v: Panch-za	t-w	ale III-			
	(1) (2)	Chuni, Rabri. (5) Sarbi	(3) (4) allie.	Lamb. Neule.	

Sub-group vi : Sat-sati-

(1)	Sajre.		Neasi.
(2)	Punj.		Chuni.
	Bandu.	(6)	

The above four sub-groups are called collectively Zat-wale.

Sub-group vii.- This comprises the remaining Bunjahi sections.

The Zat-wale stand higher than this last sub-group, vii, in that they do not accept offerings from, or eat in the houses of, Nais, Kalals, Kumhars or Chhimbas, whereas the latter do both. Moreover, the Asht-bans and Chhe-zati sub-groups claim to be superior in status to the Baris, but some families of these two sub-groups stooped to give daughters to the latter sub-group and were therefore excommunicated by the remaining families of the Asht-bans and Chhe-zati sub-group, so that they lost status and formed a new sub-group called Bans-puj. This sub-group now gives daughters to the Asht-bans and Chhe-zati sub-groups, but takes its wives, it is alleged, from the Baris.

Thus the Brahman organization reflects the main outlines of the Khatr scheme, but, though on many points of detail our information is incomplete, it is certain that local conditions modify the organization. For instance in Bahawal-pur the Khatris are few, while the Aroras are numerous and influential, so that we find the following scheme:—

Sub-group i .- Five sections, Mohla, Jetli, Jhingran, Trikha, Kumaria.

Hypergamous sub-group ii.—Five sections, Dhaman-potra, Sama-potra, Bhoja-potra, Setpal, Takht-Lalhari; and

Hypergamous sub-group iii.—Seven sections, Lalhari, Bias, Kandaria, Kathpala, Shangru-potra or Wed, Malakpura, and Bhenda.

Of these three sub-groups the five sections of the first are Brahmans of the Khatris generally, not of the Dhaighar-Bári Khatris exclusively, while sub-groups it and it are Brahmans of the Aroras in that part of the Punjab.

19. The rules of marriage.—Like the Khatris the Bunjahi Brahmans follow the usual 'four got' rule in marriage, but, precisely like the Dhaighar Khatris, the Zat-wale Brahmans avoid only their own section and the mother's relations. At least this appears to be the usual rule, but it would be rash to say it is an invariable one. For example, the Bans-puj are an exception. The Asht-bans obtain wives from them, but if a father has taken a Bans-puj wife, the son may not: he must marry an Asht-bans or lose status. That is to say, the Asht-bans may only stoop to inter-marriage with the Bans-puj in alternate generations.

Similarly the 'four-got' rule is relaxed in other cases. Thus the Kanchan-Kamal section of Hoshiarpur are also called Suraj Doaj, (sun-worshippers). Their ancestor came from Delhi as a kanungo at Hariana; hence they are called Kanungos. These Brahmans can marry in the nanka got, avoiding only the father's got. They do not take any dan (charity) and may either take service or engage in trade or cultivation. If any one of them takes to receiving charity, he is considered an outcast and they do not intermarry with him.

The ages of marriage.—Among the Bunjahi Brahmans the age of betrothal is from 4—8 and that of marriage from 8—12 years in Rawalpindi. But owing to their restricted circle of matrimonial relations the Muhial of that district have considerable difficulty in finding husbands for their daughters and the age of betrothal varies, being probably on an average 10—12 and, in many cases, the only match possible is with a widower, and matters are further complicated by the fancied superiority of certain branches to the other branches in each section. It is indeed impossible to lay down any universal rules, but generally speaking the ages of betrothal and marriage depend upon the status of each family within the group, as is the case among the Khatris.

20. The revolt against hypergamy.—It has been seen how the lower subgroups of the Khatris have endeavoured to shake off the yoke of the higher in matrimonial matters. A similar revolt against the position of the Dhaighar occurred amongst the Sarsut Brahmans. About 116 years ago, says the account received from Amritsar, the Lahoria Dhaighar used to take daughters from the Panj-zat ii; but owing to the ill-treatment meted out to the girls by the Dhaighar, they resolved to discontinue the custom, and the three other groups of the Zat-wale followed subwhile the remaining Bunjahis continued to give wives to the Zat-wale, but no longer received them in return. The result was that the Bunjahis could not obtain wives and many families died out, so it was resolved by the Bunjahis that they should for the future break off all connection with the Zat-wale, unless any of the latter should agree to give them daughters in return. This was prior to Sambat 1932 when a second meeting at Amritsar renewed the compact.

It may be worth noting that in both castes the proceedings of these conferences were conducted in a formal manner, written agreements being drawn up and the families which agreed to the demands put forward being entered in a register from time to time.

21. The territorial groups.—Like the Khatris the Brahmans have territorial groups, but these groups do not usually correspond with the territorial groups of the former. For instance, the Brahmans of the Murree Hills are divided into two sub-castes—Paharia and Dhakochi, who do not intermarry or eat together. The Dugri Brahmans correspond to the Dugri Khatris of the Sialkot sub-montane, but they are said, on the one hand, to give daughters to the Sarsut, and, on the other hand, to intermarry with the Batchru group of Brahmans in Kangra. Allusions have been already made to the Pachhada and to the Lahoria, terms which seem to be applied exclusively to the five highest sections who serve the Dhaighar Khatris.

But the most interesting territorial group of the Sarsut is that of the Kangra Brahmans whose organization shows no traces of the Khatri scheme, but reflects that of the Hindu Rajputs of Kangra, and which I shall therefore describe at some length.

22. The Kangra Brahmans.—The Sarsut des or jurisdiction extends from the Saraswati river in Kurukshetr to Attock on the Indus and is bounded by Pehowa on the east, by Ratia and Fatehabad in Hissar, by Multan on the south-west and Jammu and Nurpur, in Kangra, on the north.

Thus the Brahmans of Kangra, who are or claim to be Sarsut by origin, stand beyond the pale of the Sarsut organisation, but they have a very interesting organisation of their own which merits full investigation.

We find the following groups:-

I.-Nagarkotia.

II,—Batehru.

III .- Halbaha, or cultivating.

Group I.—The Nagarkotia are the Brahmans of the Katoch, the highest of the Rajputs, and they were divided by Dharm Chand, the Katoch Raja of Kangra, into 13 functional sub-groups, each named after the duties it performed in his time. These are—

Sub-group i.—Dicahit, the Gurus of the Katoch, who used to teach the Gayatri mantra.

Sub-group ii.—Sarotari, said to be from Sanskirt saro ladh. Their duty was to pour ahoti or offerings of ghi, etc., into the bawan kund when a jag was performed. They had learnt two Vedas.

Sub-group iii.—Acnaria, who performed the jag. Sub-group iv.—Apadhia, or Opadhi, * or 'readers' of the Vedas at the jag.

But apadhi is in Orissa translated 'title '. Vide Tribes and Castes of Bengal, I, page 161.

Sub-group v.—Awasthi, those who 'stood by ' the kalas or pitcher at the Muni-pursh, and who received the pitcher and other articles (of sacrifice).

Sub-group vi.—Bedbirch, who made the bedi, or square demarcated by four sticks in which the kals was placed.

Sub-group vii.—Nag Pundrik, whose duty it was to write the prescribed inscriptions on the bawan kund.

Sub-group visi.—Pauchkarn or secular Brahmans engaged in service on the Rajas. They performed five out of the six duties of Brahmans, but not the sixth, which is the receiving of alms.

Sub-group ix.—Parohits, who were admitted to the seraglio of the Raja and were his most loyal adherents.

Sub-group x .- Kashmiri Pandit, literate Brahmans from Kashmir.

Sub-group xi.—Misr, said to mean 'mixed,' also Kashmiri immigrants, who had preserved their own customs and rites, but had intermarried with the Nagarkotia.

Sub-group xii.—Raina, who helped the rulers by their incantations in time of war. (Said to be from ran battle-field.)

Sub-group xiri.—Bip (Bipr), now extinct in Kangra. These were parchits of the Nagarkotia and of some of the Batehru.

Of these 13 sub-groups numbers x and xi seem to be territorial rather than functional. I am unable to say what their relative rank is or was. The first six are also called the six Acharias and were probably temple priests or menials of inferior status. The Bip probably ranked high, and the Raina, or magic men, were possibly the lowest of all.

Group II .- Batchru .- There are two sub-groups-

i. Pakke Batehru .- With 9 sections --

(1) Dind, (2) Dohru, (3) Sintu, (4) Pallialu, (5) Panbar, (6) Rukkhe, (7) Nag-Kharappe, (8) Awasthi-Chetu and (9) Misar-Kathu.

ii. Kachchha Batehru.-With 13 sections-

(1) Tagnet, (2) Ghabru, (3) Sughe (Parsramie), (4) Chappal, (5) Chattwan, (6) Awasthi-Thirkanun, (7) Awasthi-Gargajnun, (8) Ghogare, (9) Nag-Gosalu, (10) Mali-Misar, (11) Achariapathiarj, (12) Pandit Bariswal and (13) Awasthi-Kufarial.

It will be observed that the Misr (section) occurs in both the Batehru subgroups and among the Nagarkotia, so that we have three sub-sections—

- (1) Kashmiri-Misr, Nagarkotia.
- (2) Kathu-Misr, Pakka Batehru.
- (3) Mali-Misr, Kachchha Batehru.

Of these the last named are parchits of the Kashmiri Pandits, the Kashmiri-Misrs and the Rainas.

The Nag (? section) are also thus found, for we have-

- (1) Nag-Pundrik, Nagarkotia.
- (2) Nag-Kharappa, Pakka Batehru.
- (3) Nag-Gosalu, Kachchha Batehru.

It is explained that Kharappa (cobra) and Gosalu (? grass-snake) are nicknames implying contempt, as these sub-sections are of low status. But a comparison with the Brahmans of Orissa

Tribes and Castes of Bengal, I, page 161.

comparison with the Brahmans of Orissa suggests a totemistic origin for these

sections.

The Awasthi too are found in all three groups.

Group III. - Halbaha. - The Halbahas have 29 gots or sections :-

Pandit-Marchu, (2) Bhutwan, (3) Khurwal, (4) Gidgidie, (5) Lade, (6) Pahde-Roptu, (7) Pahde Saroch, (8) Korle, (9) Awasthi-Chakolu, (10) Pandit-Bhangalie, (11) Narchalu, (12) Mahte, (13) Dukwal, (14) Sanhalu, (15) Pahde-Daroch, (16) Pandore, (17) Thenk, (18) Pahde-Kotlerie, (19) Bagheru, (20) Bhanwal, (21) Bashist, (22) Ghutanie, (23) Mindhe-Awasthi, (24) Prohit-Golerie, (25) Prohit-Jaswal, (26) Hasolar, (27) Poi-Pahde, (28) Fanarach and (29) Pharerie.

Of these the first fourteen now intermarry with the Batehru, giving and, apparently, receiving wives on equal terms,

Hypergamy.—The Nagarkotia take brides from both sub-groups of the Batehru, and they have, since Sambat 1911, also taken brides from the Halbaha. The Batehru take wives from all the sections of the Halbaha. When a Halbaha girl marries a Nagarkotia, she is seated in the highest place at marriage-feasts by the women of her husband's brotherhood. This ceremony is called sara-dena and implies that the Halbaha bride has become of the same social status as the husband's kin.

Social relations.—The accounts vary and the customs have, it is explicitly stated, been modified quite recently. The Nagarkotia may eat with Batehrus and have even begun to eat kachtchi from the hands of a Halbaha according to one account. According to another this is not so, and a Nagarkotia who has married a Halbaha girl may not eat at all from the hands of his wife until she has borne at least one child, when the prohibition is said to be removed.

The Batehru and Halbaha section names.—These show an extraordinary jumble of Brahminical gotras (e.g., Bashist), functional and other names, so that the accuracy of the lists is open to doubt. It appears certain, however, that some of the sections are named from the tribes to whom they minister. Thus I take the Pahda-Kotleria to be the Pahdas of the Kotleria Rajputs; the Parohit-Goleria and Parohit-Jaswal to be parchits of the Goleria and Jaswal Rajputs, and so on. This is in accord with the system, which has been found to exist among the Sarsut of the plains, whereby the Brahman takes his status from that of the section to which he ministers.

23. The Brahmans of the low castes,—As we have seen the Brahmans of the higher castes form a series of groups whose status depends on that of their clients. On a similar principle the Brahmans of the castes which are unclean and so outside the pale of Hinduism form cistinct sub-castes outside the circle of those who minister to the higher castes.

These sub-castes are-

I.—The Chamarwa.—The Brahmans of the Chanor sub-caste of the Chamars.

II.—The Dhanakwa,—The Brahmans of the Dhanaks or Hindu weavers in Rohtak.

III.—The Brahmans of Chuhras.—

Each of these three sub-castes appears to be now strictly endogamous, though the Chamarwa are said to have until recently intermarried with Chamars. However, it seems clear that they do not intermarry with the other Sarsut Brahmans.

24. The functional groups.—Again, below the Brahmans, who perform priestly and ceremonial functions on auspicious occasions for the higher castes, are certain lower groups whose function it is to receive gifts at unlucky times or when misfortunes occur. Such are the Vaid-patar* who are given alms to take upon themselves the evil influences of Sanichar (Saturn), and of Rahu, the descending node ': the Sawani, who are vagrant Brahmans, fulfilling similar functions: the Dakaut, Dan-gotra or Dakot-

Punjab Census Report, 1883, § 513.

ra, who are the 'scape-goats of the Hindu

religion': and the Acharj. The latter appears to be the same as the Maha-Brahman and performs funeral ceremonies.

Whether these functional groups form true sub-castes or not, I cannot say, but the latter at least are in Dera Ghazi Khan divided into two groups, thus :-

> Group i.-Bari-Sections. Group ii .- Bunjahi -- Sections.

(1) Sirsewal.

(1) Ghanghar.

(2) Sonamin.

(2) Obhats.

(3) Khal.

Group i being hypergamous as regards ii. The distinction is, however, said to be dying out.

Locally other groups are mentioned, but how far they form sub-castes does not appear, though the Acharj and Bhat are said to be, locally, endogamous. Thus

Parchit in Jhang three classes of Brahmans are the flam of the fla religious services: while the Naraini depends for a living on Narain or, in other words, lives by begging, or even by labour, occasionally acting for a parohit or thani. The Thanis are maintained by all, whether Hindus or Muhammadans, if their patron is influential.

Astris, in Mianwali, are a class of Brahmans who help Hindus in their daily worship. They receive a loaf from each house daily, besides fixed lags or dues. In Dera Ismail Khan there are six classes; the Gosains or Mahants, who hold shrines: the parohits who perform special ceremonies such as those at marriages and funerals: the Astris who carry out the ordinary rites on the sankrant, amavas and so on : the acharj who receive gifts after a death : the Bhat who are only menials employed as messengers, and lowest of all the Vaid-patar already described.

25. The Pushkarns.—This group is popularly supposed to take its name from the lake of Pushkar or Pohkar near Ajmer, because a fragment of them were originally Ods or spademen who dug out the lake. It was also called Sri-Mali, which is the name of a Bania sub-caste. That they are immigrants from Rajputana is certain, because they are the Brahmans of the Bhatias, but they are of low status, serving sections of Aroras which have lost caste, and in Sialkot giving daughters to the Dugri and Jatka Brahmans. Whether they should be regarded as a territorial or as a functional group I am unable to say, but they have the following sub-groups :-

- 1. Marecha, or Khalis (pure).
- 2. Dassa, or half-caste.
- 3. Sendhu.

Marecha is a territorial name denoting their origin from the desert of Rajputana.

The first two sub-groups are said to comprise 15 sections :-

1. Ranga.	6. Wissa.	11. Kirara.
2. Ramde.	7. Gajja.	12. Lodhar.
3. Kalhe.	8. Khidana,	13. Kabthe.
4. Parohe.	9. Acharj.	14. Bhora.
5. Bias.	10. Muchchan.	15. Chhangane.

The third sub-group, Sendhu, has two sections:-Matter and Wattu, of which the Wattu is considered the lowest section in the whole Pushkarn group.

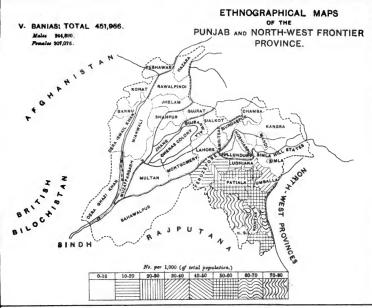

^{*} In the towns the parchit and thans divide the income, the former getting two-thirds, the latter one-third.

			Status-group	os.

THE RAJPUTS.

26. The Hindu Rajputs of the Eastern Hills.—In the eastern hills, which lie in the north-east corner of the Punjab, we have a type, and undoubtedly a very ancient type, of Hindu society which has been practically untouched by Mohammadan influences, though possibly Buddhism may at one time have affected its development. This society has an exceedingly complicated organization, based on the two principles of natural descent and social status independent of that descent, which we have found to exist, in a comparatively simple form, among the Khatris. Caste, in the accepted meaning of that term, may be said not to exist. The highest stratum of society is composed of a number of tribes which are split up into several groups of different social status, and which are generically called Rajputs. Below these Rajput tribes are the cultivating classes, the Kanets and Ghiraths, and below them again the artizans and menials.

The Rajputs consist of numerous tribes divided into still more numerous septs or als, both tribe and septs being based on natural descent. The al does not appear to be necessarily exogamous, for in some cases the tern is used as practically equivalent to 'family,' and what the exogamous unit really is I am unable to say.* The tribes are split up into six status-groups in the manner shown in the table on the opposite page, so that the order of social precedence stands thus:—

These terms require some comment. It will be observed that the term Rajput appears to be used in a restricted as well as in a general sense, and as this two-fold meaning has led to confusion I propose to call these groups, collectively, the Rajput-Rathi groups. It will further be seen that each of the terms used denotes status, not race, or caste, or tribe. Thus there can, I think, be little doubt that 'Rajput' simply means 'descendant of a raja, or ruler,' and it is also certain that the term is a purely functional one. Mr. Barnes for instance says:—'Two of the old royal and now essentially Rajput families (of

Barnes' Kangra Settlewent Report, 173.

Brahman by original stock.' Mian' literally means 'prince,' and as the members of that grade are entitled to the salutation 'jai dia' they are also called 'Jaikaria,' but this group is also called, vaguely, Rajput. Of the other terms 'Thakur,' or 'Baron,' and 'Rana' or 'Chief,' are simply titles denoting status or rank, while it is suggested that Rathi is derived from rakhebi (which is an equivalent of karewa, or widow remarriage). However this may be Rathi is a term which implies loss of status and so it is rarely used by the Rathis themselves. Thus all the terms in use denote status and nothing else.

Lastly, it will be seen that the *tribes* are not graded according to status, for we find that even some Katoch septs are quite low down in the scale, though for the most part the Katoch are of Mian or Jaikaria status. Status depends mainly on the strictness with which certain social rules are observed. Thus 'the Mian and the Thakur must not permit widow re-marriage.' Further a Mian should not plough, give his daughter in an inferior class, nor take a wife from it.† He may not accept any price for a daughter, and his women-folk must observe

[&]quot;It is worthy of notice that there is some vagueness of idea, and probably indefiniteness of custom, about the prohibited degrees" among the jats and Brahmans of the south-east Punjib (Code of Tribal Custom, Gurgaon, nog 20).

[†] But he may take a wife from an inferior status-group. The term 'class' here seems to be used loosely for caste.

strict parda. The chief distinctions between a Mian and a I hakur seem to be that the latter may plough and also may take a wife from a Rathi. The Jaikaria are not supposed to eat kachchhi, or smoke except with one another, but in practice it is regarded as a venial offence if they do so with the grade next below them. The Rathi practises karewa, and that distinguishes him from the Rajput. They also accept a bride-price, but are in this respect only on a level with the Thakurs, who often do the same, or effect exchange betrothals.

But in former times, if not now, status could also be gained by royal favour, for a raja might promote a Ghirth to be a Rathi, or a Thakur to be a Rajput, Lyall's Kingra Settlement Report, 51:73 and 65. for service done or money given. By giving a daughter to an impoverished raja a rich Rathi may raise his clan—not merely, it would seem himself or his family—to Thakur Rajput status. If a raja takes a Patial girl, whom he has seen herding cattle and fallen in love with, the girl's whole clan begins to give its daughters to Mians, and gains a step in the social scale. On the other hand, by practising widow remarriage or giving a daughter to an inferior grade, status could be diminished or lost.

The effects of this system are seen in the varying status of the septs in each tribe, but the complexity of the system is not fully brought out in the table, for there are degrees of social status, even within the sept, based on proximity to its original home. Further we find that in each status-group some also or septs are hypergamous, while others are not, for they refuse to give daughters to the next highest group. Lastly, the status of a tribe may vary with the locality in which it is settled.

In fine, Rajput society is in a state of chaos and it is hardly possible to give any clear account in detail of its various ramifications. Moreover, any such account would probably be obsolete in a few years, for society is in a state of flux, but the fluctuating units are the septs or als, or at least the families, not the individual members of the tribe.

The relations of the Rajput-Rathi groups to the lower castes,—As we have seen the Rathis give daughters to the Thakurs and they in turn to the Mian, a system which apparently finds expression in the saying:—'Chauthi pirhi Rathii ki rani banjae' or 'in the fourth generation the Rathi's daughter Ghitth, proverbs in the Monograph on the Kangra Ghitths, becomes a queen.' This is Panjab Government Press, 1960. to be explained as meaning that a Rathi's daughter, the first generation, may marry a Thakur in the second generation. In the third her daughter may marry a Rajput and ker daughter again may marry a Mian or a ruling chief. At least this is the only way in which the expression "fourth generation" seems explicable. There is a similar saying regarding a Kanetni, or the daughter of a Kanet, who may in the fifth generation become a queen. Lastly, there is the saying:—'Satvin pirhi Ghir/lini ki

See § 72 of Sir J. B. Lynli's Kangra Settlement Report.

daughter becomes a queen.' But even this does not close the circle of marriage relationships. The Rathi may contract a jhanjrara or second marriage with a woman of another caste, such as Jat or Jhiwar, and the issue by such a marriage are deemed legitimate. Thus we arrive at once at the obvious conclusion that there is no endogamous Rajput 'caste' at all, and moreover there are no sub-castes, but a series of status-groups, each more or less

Results of the Rajput social system.—The Rajputs of the hills exhibit some of the usual features of a society organized on a system of hypergamy. 'Rajputs of high family are heavily bribed to marry owing to the

feeling of pride which forbids a Rajput to marry a daughter to any but a man of equal or rather superior family but his own. Here we have Kulinism in full force. The Rajputs of the third grade or Thakurs are thus placed in a peculiarly unfortunate position. On the one hand, they have to buy husbands for their

hypergamous.

VIII.

daughters. On the other hand the Rathis will not give them daughters without exacting a price, so that they are mulcted both when marrying and when giving in marriage.

27. The Rajputs of the Jammu Hills.—In the low hills and sub-montane area which form the Northern boundary of the Districts of Gurdaspur, Sialkot and Gujrat we have a mass of Rajput tribss, some Hindu, some more or less recent converts to Islam. Further west in the hills of Jhelum and Rawalpindi are found numerous and important tribes of Rajput status, which if ever they were Hindus have now been almost completely Mohammadanized. All these tribes are divided into still more numerous septs, of varying status, but our information regarding them is imperfect and often conflicting, probably because the distinction between the tribe, based on natural descent, and social status, which is independent of descent, has not been kept in view. The clue to the intricacies of their organization is doubtless to be found in a recognition of the fact that each tribe is split up, as in Kangra, into various social and territorial groups. For example, it is usual to speak of the Salehria Rajputs as a tribe, but the term appears to merely mean 'low-lander' and it is probable that the Salehria tribe is really composed of a number of septs or fragments of tribes which happen to be settled in the salehr or sub-montane tract.

Gurdaspur Gazetteer, 1891-92, pages 68-70.

67. 3160 Anesswent Report of Gurdaspur Carpants.

For the Gurdaspur Rajputs it is sufficient to refer to Mr. L. W. Dane's account of the complex system of hypergamny which there exists. There are four hypergamous groups:—

(i) Jaikaria, avoiding widow re-marriage, ii) Kahri,

(iii) Dohri, who exchange brides, apparently, and practise widow remarriage.

(iv) Thakkar, corresponding to the Kangra Rathis.

The Jaikaria further have two grades, hypergamous inter se, one the true Jaikaria, the other with a doubtful right to that title.

In Sialkot a similar state of things exists, but the details have not been Sialkot Gasetter (old edition), page 45.
History of Sialkot, pages 37. etc. econflicting information available.

In Guirat the Chibbs appear to have a two-fold system of grades, one based on descent, the other on their feudal tenures. The Ghaniyal division stands highest, having always been the royal clan, and it objects to giving daughters in marriage. The Sanwalia, Miana and Malkana subdivisions rank high and so intermarry, or give their daughters to Sayads or Gakkhars. The feudal grades are the Mandial, Garhial and Dherial and originated thus:—

The Bhimbar raj had 4 mandis, 4 garhs and 84 dheris. The mandis were figure to the younger sons of the raja, the garhs having been given to the younger branch, and the dheris being allotted to the sons of concubines. As time went on the raj and the mandis were inherited of the eldest son's clan, other sons being given dheris only. The Mandial are thus superior to the Garhial, and so on, but it is difficult to say which families are one and which are another, though feeling runs high on these questions.

28. The Rajputs of Rawalpindi and Jhelum.—In Rawalpindi there is a confused system of hypergamy which does not lend itself to brief description. The Mohammadan Janjuas, I may note, have two divisions, Vair and Jodh, the latter being hypergamous. The Mohammadan Ghakkhars have also a system of hypergamy within the tribe for the highest septs, the Admal and Sarangal will not give wives to the five lower septs, and in Jhelum one small sept, the Talial, is little esteemed and does not intermarry with the others. The lower septs may in turn take wives from the lower classes of Mohammadans. The Jhelum Ghakkhars have mandis, like the Chibbs, but do not seem to have any social grades based on the feudal divisions.

29. The Rajputs of the Plains.—I shall touch but very briefly upon the characteristics of the Rajputs of the plains. If we except the tribes of the East and South-East Punjab, of whom some remain Hindu, the great mass of the Rajputs of the plains have been long since converted to Islam. Conversion has led generally to complete abandonment of the law of exogamy, and it is doubtful if in any case hypergamy is at all general, because there is a strong feeling that a man should marry in his own sub-division, and inability to obtain a wife within it implies some social disgrace. At the same time there are comparatively few tribes, at least in the Central and South-West Punjab, which do not retain traces or traditions of hypergamy and within the tribe. Confused and uncertain as the tribal organization is, there is hardly a tribe or clan which is not sub-divided into a number of septs and even families, graded on a hypergamous system.

Below the Rajput tribes come the Jats, and the line between them is very shrply drawn in the eastern districts. In the central districts it is less defined, and in the West and South-West Punjab, cis-Indus, the term Rajput is but little used and 'Jat' denotes nothing more than poor or peasant. Trans-Indus, in Dera Ghazi Khan, the Rajput is replaced by the Baloch (Baroch, or chieftain), who is usually quite distinct from the subject Jat or cultivating class, although both Baloch and Jat elements appear to have combined to form the tribe (so-called) of the Khetran (or field-workers). Thus in the oldest type of society, that of the south-west, amongst the earlier Aryan invaders, we seem to find a purely tribal organization with no well-marked social cross-divisions. As we go farther east, we have the distinction between the Jats or peasantry and the Rajputs or gentry more and more sharply defined until, when we reach the Juma Valley, we find that these social grades have crystallized into castes.

Consistently with this theory there is no inter-marriage between the Rajputs and Jats of the eastern plains at the present day. Towards the south-centre of the Punjab, however, we find that there are tribes of Jat status who give wives to Rajput septs. For example, the Bharwana sept of the Mohammadan Syals in Jhang take wives from the Sipra Jats 'who curiously are found associated with them in all their villages,' while

Jhang Settlement Report, f. 44. chard the Khanuana sept of the Syals may take their wives from the Chaddrars who are of samindar, i.e., Jat status.

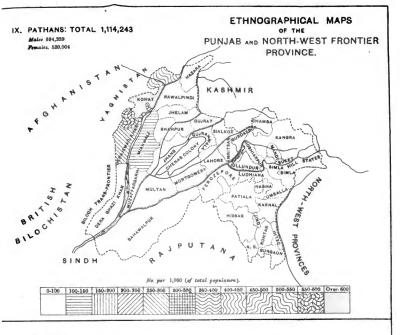

There was indeed conceivably a time when the hypergamous relation between the Raiputs and the lower grades was more common, but it would appear that at an early period the desire to maintain purity of descent led to the rule that the children should follow the status of the mother. Numerous tribes of Jat and Gujar status have traditions that they are descended from Raiput fathers by Jat or Gujar wives, and therefore they rank as such and not as Raiputs. That inter-marriages between Raiput men and women of lower groups were not illegal, and did not make the children altogether illegitimate may be inferred from the rules of succession which, even in the south-east of the Punjab, Coleof Tribal Custom, Gurgaon, page 21 (c) permit the issue of such marriages to succeed to a share (though not to a full share) of the land. There appear in fact to have been degrees of legitimacy,

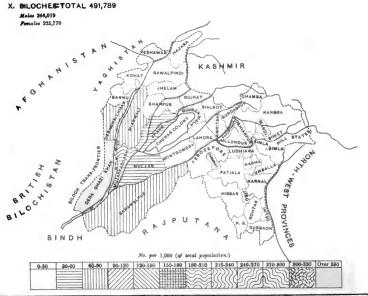

share) of the land. There appear in fact to have been degrees of legitimacy, varying with the status of the wife, so that every son inherited, but his share varied with the purity of his blood, † It may be suggested that many apparent cases of succession per stirpes (chundavand) are really instances of unequal succession due to differences of status between children of wives of unequal status.

30. The Biloch.—Turning for the moment to the south-west of this Province we find that the Biloch have a similar system. In paragraph 683 of his Census Report Mr. Ibbetson indeed said that:—"The law of isogamy... is professed at least by all the dominant Mussalman tribes or races of the Western Punjab."

I venture to doubt the correctness of the received explanation that such traditions point to a system of hinship through females.

[†] This reluctance to altogether disinherit illegitimate children was marked in Scotland and in Wales (Seebohm, Tribal System in Wales, page 52).

VIII.

The case of the Jats in Muzaffargarh is then cited as showing that Biloches and even Sayads give daughters to inferior tribes, but in that District the Biloch takes a somewhat lower place than he does west of the Indus, † and in Dera Ghazi Khan Mr. Diack notes that Biloches take Jat wives, but do not give their women in marriage to the Jats. Pandit Hari Kishen Kaul, moreover, now writes as regards the Biloches :-

"A man belonging to a high caste will generally not give his daughter into a lower caste. Barring Sayads the Biloches consider themselves the highest caste in the District. A Biloch will take his wife from among the Koreshis, Pathans and Jats, but will prefer to give his daughter only to a Biloch. Giving a daughter to a Sayad, Pathan or Koreshi is allowed, but only in cases of extreme necessity is a Biloch girl married to a Jat. Rind, Hot, Gurmani, Jatoi, Laghari and Drishak Biloches strongly object to give their daughters to Jats.

would not give daughters to Jats. Sayads do not as a rule give Pathans daughters to others than Sayads and Koreshis."

In Gurgaon a Biloch may marry a woman of another tribe, such as a Sheikh or Rajput, but a Biloch girl can only marry a Biloch. Code of Tribal Custom, Gurgaon, page 22. Probably the Biloches, like the Meos, had once a system of hypergamy which has now almost disappeared. And cis-Indus I am now told that the Rind tribe is the highest of all, and will not give daughters to the tribes below it.

31. The Rajput Chhat and Makan .- The Rajputs in certain tracts chiefly in the sub-montane Districts of the Eastern Punjab, have certain villages called chhat, which are of the first rank, and others of the second rank, called makan. Chhat apparently means 'roof,' and makan has its usual meaning of

' house '. Mr. Purser has Juliundur Settlement Report, paragraph 36. given an account of the Ghorewaha Rajput system. There are 9 chhat and 12 makan, and these villages do not seem to have any relation to the genealogical divisions of the tribe, which is

also divided into 12 muhins or septs, depending on descent.

In Gurgaon each Rajput tribe has its chhat, with one, or more, apparently subordinate makans. The Deputy Commissioner furnishes a list of 23 tribes which have numerous chhats or makans, and states that six months at least would be required to obtain a complete list.

In Karnal and Hissar the system appears to be unknown, but in Ambala, Ludhiana and Patiala it is in full force. Originally there were, it is said, six Rajput 'Darbars' or courts, at Kapurthala (of the Bhattis), Talwandi, Hothur, Kot-Isa Khan (Manj), Bhatner and Jaisalmir. In lieu of these, in the reign of Babar, 12 chhats and 24 makans were constituted, but the numbers soon interested to 6 and at reasonable und the little and the same of the sa increased to 36 and 35 respectively, and the lists sent to me show that the present numbers must be far larger. Each tribe has a certain number of chhat and matan and the member of a chhat always pays twice as much to the mirasis at a daughter's marriage as the member of a makan. ! But the fees vary in each tribe, thus :- The Barah Rajputs have 12 chhats (paying Re. 1 to each mirasi) and 24 makans (paying As. 8). The Taons have 14 chhats (paying Rs. 7) and 24 makans (paying Rs. 3-8). The Chauhans have 12 makans (paying formerly Rs. 11, but now Re. 1 only), but no chhats, and the Rao and Dehia too have, it seems, makans only.

In the District of Gurgaon there are traces of a similar system among the Gurgaon Sett. Rep. § 41. Code of Tribal Custom, Gurgaon, pages Meos, who profess to have 12 pals and 52 gots-a curious fact, for their organization can hardly have been borrowed from the Khatris, who are hardly found in Gurgaon. The pal is simply a large got, and means literally a defile or valley. Thok appears to be a smaller got, not a sub-division of a

But cf. page 68 of the Muzaffargarh Gazetteer, where Sayads are not mentioned. Possibly the Kahiris in Sanawan Tahsil are alleded to, but their claim to be Sayads is not generally admitted (page 69 of the Gazetteer). † The Chandia and Lechari Biloch (who are not pure Biloches) will give daughters to Jats.

[†] In pargana Narnaul there is a curious rule. When the father of the bridgroom gives a house full of requisites to a mirasi it is called tyag: when he only gives a fixed sum for the house it is called tehh or account.

village, which is its meaning in the Punjab. Certain pals or thoks would give daughters, but not take them from other pals or thoks, but these distinctions are now said to be quite obsolete.

THE JATS AND GUJARS.

32. The Fats .- Of the four types the Jat is the simplest in its organization. While the Rajputs and their dependent tribes form a series of grades the Jats comprise a vast congeries of tribes which are practically on a dead level of equa-lity, although some of them have a vague and undefined superiority over the mass of the Jat race. As a rule, the Jats practise karewa and do not wear janeo, but certain tribes avoid the former custom without acquiring any definitely superior status to those who retain it, while the Jats of a certain village may wear the janeo without distinctly raising themselves above the level of their tribe. On the other hand, there are in many Jat tribes individual villages, or even families, which claim and exact recognition as the social superiors of the mass of the tribe, but there is no caste above the Jat. Neither territorial sovereignty, nor the avoidance of widow re-marriage, nor refusal of the bride-price will raise a Jat tribe to the status of Rajput, a fact all the more remarkable in that many Jat tribes have traditions of Rajput origin. This democratic instinct is apparent amongst the lats both in the Maniha in the Punjab Proper and in the Malwa. It is independent of religion, for the Hindu Jats of the south-east remain as democratic as those of the Central Punjab. The organization of the Sikh Khalsa, the peculiar property of the Guru, subject only to him and owning no other allegiance, illustrates this instinct which found its outward expression in the term misl (equal) used for the Sikh regiments, whose affairs were administered by pancha-yais, the quasi-sacred council of five. This democratic principle was probably not inspired by Sikhism, but gave its own characteristic impress to that creed, which in return fostered its development by compelling its adherents, of whatever caste, to receive the amrit at baptism on terms of absolute equality-a practice which subsists to the present day. And herein lies the explanation of the reluc-tance of the Khatris, despite their close connection with the religious history of the Sikhs, to formally enter their communion; and in the same way the nonadherence of the Rajputs to Sikhism is accounted for.

This doctrine of equality has left its mark on the customary laws of succession, of property, and I think, of marriage. The principle of succession among But of. Customary Law XI, pages 4 and 11. (Amritar.)

(Amritar.)

This doctrine of equality has left its mark on the customary laws of succession, of property, and I think, of marriage. The principle of succession among the Jats is equality, whether the division be per stirpes or per capita. Amongst the

Rajputs there are traces, it would appear, † of a custom which gave the sons unequal rights of succession, the share which fell to each on a partition depending on the status of the mother. Among the Jats no such distinction exists. There is no bar to marriage with women of the lowest castes, and the issue succeed equally.

Only amongst the Jats do we find the bhaiachtrat tenure, the custom by which there was no division of the land, each family cultivating what it could until possession became the sole measure of its rights. The Jats never appear to have had any customs such as the samaya or jithunda, the extra share given to the eldest son, with no doubt a correspondingly greater liability for the family debts. To such an extreme was this principle carried that the rise of the Jats

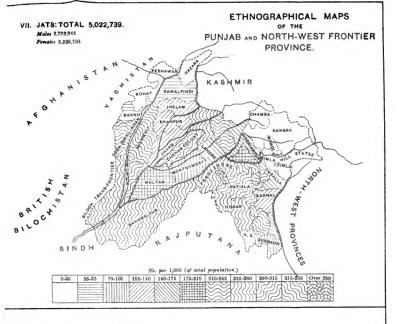

^{*} As Mr. libbetson has pointed out, Ranjit Singh did not strike coins in his own name, but in that of Guru Nanak (Nanakanhir rupees), and though he adopted the title of Maharia, used the impersonal term * Sircar' to denote the authority from which his orders issued. (P. N. Q., 1884, Section 638).

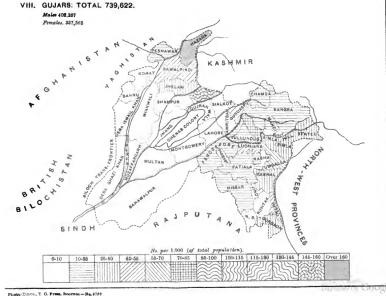

^{† &#}x27;In no case,' writes Mr. W. S. Talbot, 'are children by a marriage outside the group excluded from succession. In certain tribe the issue of marriages with low-caste wires do not get a full share, but this is not because the wife is of another tribe, but because she is low-born. (Jhelum, This, I believe to be the Rajput rule.

t Using the term in the molth seams of some orange. (Design.) This, I believe to be the Rajput rule.

I Using the term in the Pumpis seams and restricted to tenures in which possession has become the measure of right." (Donic's Pumpis Settlement Manual, page 64, Section 127). True bhafachara or the clandifacturing method, which consists in an experial folloment of the land according to quality, resulting in its whole area being divided into blocks according to quality, and each sharer getting his portion in each block, is also a 1 lit taners. Baden Powell was inclined to think that the tree bhafachars, or method of equality valuated holdings, is a jat, or at least not a Rajput, principle.

⁽The Indian Village Community, pages 216, 275, 356-7, etc.).

to political power caused little change in the principles on which their heritage was divided. The conquests south of the Sutlej were allotted in much the same way as the waste land of a village would have been brought under cultivation by a sept, and the present configuration of the Phulkian States, and of Kalsia, is a testimony to the strength of this principle.

From the same instinct the practices of unavowed polyandry and acknow-ledged karewa appear to have arisen, or at least to have been maintained.

**Karewais all but universal among the Jats, and even Maharaja Sher Singh took to

Griffin's Penjab Chiefis, page 10.

and even Maharaja Sher Singh took to wife his brother's widows, a proof that the custom is not due to want of means. In an intensely communistic fraternity the tendency might well be to share the women precisely as the land is shared.

It follows from what has been said that tribal hypergamy does not exist amongst the Jats, nor do we find anything resembling the status-groups of the Rajputs and Khatris among them. No doubt the vague superiority of certain tribes leads to their taking wives from the inferior tribes to which they would refuse daughters, but there is nothing approaching a general rule, and status virtually of a tribe, in any given locality, depends on the amount of land it holds.

The Gujars.—Like the Jats the Gujars in Gujrat have 2\frac{1}{2} asli or original sub-divisions, Gorsi, Kasana, and Bargat, the latter being the 'half' sub-division as descended from a slave motherf. In Karnal the 'Dhai-got' are said to be the Gorsi, Chechi, and half of Kasana. There is, however, no tribal hypergamy among the Gujars, the only instance of hypergamy being in the Dhalak family of Keorak in Karnal which will only give daughters east of the Jumna, though it takes wives from the Gujars of the District.

The Gujars in the Gujrat District, but not it seems elsewhere, have a sacred sub-division, called Barra, which claims to be of Janjua descent, a jagir of that tribe having married a Gujar wife. The Barras are usually called Mianas, but a few families of the sub-division are not Mianas, having forfeited their sanctity. There are also Miana families among the other Gujar sub-divisions. The rule is that a Miana family may not give a daughter to any but a Miana family in marriage, though it may take a girl of any Gujar sub-division in marriage.

33. Social distinctions among the Jats and Gujars.—Amongst the
Hoshiarpur Gazetteer, page 56.

Jats there are the well-known 'Akbari' or
Darbari makans—35 in number according

In the Amritsar District, however, the Akbari is only the highest of a series of four, Aurangzebi (or those admitted to this rank in the time of Aurangzeb), Khalsai (or those admitted in the Sikh times) and Angrezi (or those admitted since British rule began) being the other three, and no less than 150 villages, all generally speaking in the Manjha, claim Darbari status. As regards the Gurdaspur District, Mr. L. W. Dane wrote:—

"There are other restrictions on the marriage tie prevailing amongst the Hindu Rajputs which, however, would hardly be sufficiently strong to render a marriage contracted in violation of them unlawful. Thus a man of a higher got may not, as a rule, give his daughter to the son of a lower class, though he can take a wife for his son from that class. The subject has been fully noticed in the Gazetteer, page 69. Some of the better gots of

Mr. Drummond indeed observes:—"There can be no question that the Randhawas, who are still Thakurs in the randhawas, believe, in Rajputana, are at the head of the hypergamous scale among those Jats who have a more or less distinctly Rajput origin, such as the Gil, Sindhe, Sichhe-Barar (Or Variar), Panna (P Punwar), and the like." Unfortunately no one Beems able to say what the hypergamous scale among the Jats is, land several of my informatic scalificility any there is nome.

[†] This is not admitted by the Gujars in Ludhiana.

[‡] There is also a Shahjahani grade, the Sansi Jats, of Raja Sansi, having been admitted in the reign of Shah Jahan.

Hindu Jats or those living in celebrated villages or namas will not give their daughters to men of gafs considered socially inferior, and the restriction often gave rise, to female infanticide, as eligible husbands were scarce. Some of the higher Mohammadan Rajputs also hesitate about giving their daughters to men socially inferior, though by religion equal." (Customary Law of the Gurdaspur District, page 5.)

The Gujars of Gujrat have a remarkable system of darr (literally a door or threshold), thus described by L. Piara Ram, E. A. C.:—

This system of social grades seems to be quite independent of tribal status or descent. The antiquity of a village, or of the settlement of a family in the village, seems to be the main consideration, and families are constantly rising in the social scale, by being admitted to rank as "Darbari," darrwala, etc., and their descendants, however numerous, retain that status, provided they observe the chief rules which seem to be that a daughter shall only be given in marriage in a village of equal or higher rank and that lavish fees be paid to mirasis at the marriage of a daughter. It is in connection with this scheme of social rank that the law of hypergamy finds its fullest scope, though other forces also come into play.

34. The origins of the Jat tribes,—In the Punjab Proper the aski or original tribes are the Man, Bhular, and Her, and these three tribes are like the Dhaighar Khatris spoken of as 'two and a half,' Her being said to be the half tribe. In the south-east of the Punjab the Jats are divided, in very much the same way as the Banias of that region, into two territorial groups, Deswall, or indigenous, and Bagri, or immigrants from the Bagat, and also into two groups, based apparently on their ancient cults, called Shib-gotr and Kashib-gotr. The former are also called aski Jats, and do not claim Rajput origin. They have twelve septs, but the septs do not appear to be exogamous sections, and thus the Shib-gotr must intermarry with the Kashib-gotr, but, in order apparently to get over the difficulty of a difference in cult, their got is at marriages proclaimed to be Kashib-gotr.

As a general rule, the Jat tribes claim Rajput origin. Even the Sansi Jats, who have now taken to calling themselves Bhattis, advance that claim, and

Lepel Griffin's Penjab Chiefs, page 13.

Sansi, the first person who came to the house after his birth, in obedience to the behest of the Brahmans and astrologers. The fact remains that the bulk of the Lat tribes claim to be immigrants from the south or south-west of the Punjab of Rajput descent.

Rules of marriage.—The Jats, as a whole, marry outside the tribe, which thus represents the got, and avoid the usual four gots in marriage. To the former rule, however, the Sidhu-Barar Jats are an exception, for they have to marry within the tribe but outside the muhin, though in the south-east intermarriage between tribes of common descent is usually avoided.

Re-marriage of widows is permitted, whether with an elder or younger brother of the husband, and further, if a girl has been married to one brother and he dies, it is sometimes held sufficient for his younger brother to go through the ceremony of muklawa with her, without any formal second marriage.

Or possibly it is unlucky to pronounce the name of Shiva at a wedding, or the Brahman may object to
reprise the cult of Shiva, but seeing that the Maheshri Basias are endogamous, the above explanation is probably
correct.

The Banias. THE BANIAS.

35. I give here a detailed account of the Banias and the castes connected with them, because I fancy there is a different principle of classification to be traced in the castes of the South-East Punjab, whose original home was in Rajputana. This principle is a cross-division, of territorial groups, based on religious differences. These differences arose in the conflicts between the cults of Siva, Vishnu, and the Jains, and have left their mark on the organisation of the higher castes in that part of the Punjab.

Organisation .- The organisation of the Banias is exceedingly obscure. They have certain territorial divisions, but there is also a true sub-caste, called Bara-Saini* in Gurgaon, which is said to be quite distinct from the others. They are descended from Chamars and at marriage the boy wears a mukat or tiara of dak-leaves, shaped like a basket, into which a piece of leather is fixed.

The territorial groups are at least three in number. Of these the chief is the Agarwals, and there is a curious legend about their origin. Bashak Nag had 17 daughters, who were married to the 17 sons of Ugar Sen, but these snake-Cf. Punjab Census Report, 1853, Section 533. daughters of Bashak used to leave their homes by night to visit their parents, and in their absence their husbands lived with their handmaidens and descendants of these are the Dasa or Chhoti-sarn gots of the Banias, each got taking its name from that of the handmaiden from whom it is descended. The children of Basakh Nag's daughters formed the 17 gots of the Agarwal. Once a boy and girl of the Goyal got were married by mistake and their descendants form the half-got called Gond,‡ so that there are 17½ gots in all. And again one of the sons Hissar Gazetteer, 1892, page 137.

of Ugar Sen married a low-caste woman and his descendants are the Mahwar got which cannot smoke with other Banias. The Agarwal-Mahajans only avoid their own section in marriage (Jind).

The second group is the Saralia, who are an off-shoot of the Agarwal and appear to have the same gots.

The third group, the Oswal, appears to form a true sub-caste § They strenuously claim a Punwar Rajput origin, but other Rajputs of various tribes joined them. Sambat 422. They had followed one of their Brahmans in becoming Jains, in

† The Agarwal gets include :-

8. Mangal, 9. Tahil, 10. Kansal 11. Bansal, 12. Mahwar, 13. Goyal or Goil, 14. Gond. 1. Jindal. 3. Gar. 4. Eran. 5 Dheran. 6. Metal. 7. Mansal.

Of these Kansal and Bansal are named from home, a grass, and bons bamboo, and they do not cut or injure

t Or Gand, that the Gand or impure section of the Bhatia, note to para. 30 supra. In Juelum the Gond and Billa sections do not intermarry, being descendants of a common ancestor,

f The original Oswal gots are said to be :-

1. Thaker, 2, Baphna (Rajput, by origin), 3. Sankhli, 4. Kamawat Punwar (Maheshri), 5. Mor Rakh Pokarna, Sankla Punwars, 6, Kuladhar, Bribat Punwars 7. Sri Srim, Sankla 8. Srishtgota, Punwar, g. Sochanti, Punwar,

11. Kanbat 12. Baid, 13. Tagu Srishtri, Sankla, 14. Burugotra, Bhatti, 15. Dadu 16. Chorbheria, Raghubansi,

10. Bahadur, Punwar,

17. Kanaujia, Rahtor, 18. Chuichat.

19. Kotari, or keepers of the treasure-house, but the last does not seem to be a true got, so that there were only 18 gots, as there still are among the Agarwal.

The Build are said to have been originally of the Stishgota and to have been so-called, because Davi effected a minculous care of the eyes of a girl belonging to that section by causing a special kind of at 10 grow, the juice of which healed them.

^{*} From bara, 12, and seni, an army (Crooke's Tribes and Castes of the North-Western Provinces and Oadh 1. page 177.)

Hence there are three territorial groups or sub-castes, and a fourth of lower status based on descent:-

Sub-caste III. Oswai,—Irom Osiana

Sub-caste IV. Bara-Saini.

Apparently there are, besides these territorial groups, cross-divisions of the case based on religious differences. These seem to be Saraogi or Jain, Maheshri or Shaiva, Agarwal-Vishnoi or Vaishnavas. But the Maheshri, who undoubtedly derive their name from Mahesh, or Shiva, are not now all Shaivas, for one of their number was in consequence of a miracle converted to Jainism and so founded the Tahtar got of the Oswal, whose Kamawat got is also Maheshri. It would appear that the Shaiva groups formed true sub-castes, for the Maheshri certainly do not intermarry with the Agarwal or Oswal, but Vaishnava and Jain Agarwals intermarry freely in Gurgaon.

The Mahajans of the eastern hills.

There are two territorial groups :-

1. Kangria, who inhabit Kangra Tahsil and the east of the Kangra valley.

II. Goleria, who lie more to the west. The latter look down upon the former, because they were given to the use of the liquor, a practice now common to both. The two groups do not intermarry, but the Goleria intermarry with the Mahajans of Jammu and Chamba.

36. The Bhabras.—In Jind—or according to an account received from Jind—there are two groups in this caste:—

Group I. Oswal or bisa, i.e., of the whole blood.

Group II. Srimal, or dasa, i.e., half caste.

These groups are said not to intermarry. The former avoid only the paternal got in marriage, while the latter observe the four-got rule. On the other hand, the Nabha Bhabras are said to have two sub-castes, Oswal, who observe the four-got rule, and Kundewal, who avoid only their own got in marriage, while in Maler Kotla the Bhabras or Oswal are said to avoid two gots.

37. Hypergamy.—From the medley of facts given in the foregoing pages, the hypothesis, advanced in paragraph 3 of this chapter, has I think been fairly well established. The higher castes are split up into various status-groups, which are often, but not always, hypergamous. It is also easy to see how this system developed.

From time immemorial the Punjab has been the chief out-work of India on which successive hordes of invaders have fallen. As each horde raided into the Punjab it subdued the hordes which had gone before it and was in turn subdued by the one which came after it. These successive invasions utterly exterminated or expelled the Dravidians, if indeed that race ever occupied the Punjab, for no traces of a Dravidian element are to be found in the present population. The latter invaders thus found an exclusively Aryan population already settled on the land, and they had not therefore to deal with the questions which in lower India arose out of intermarriage with the aboriginal races and which were solved by evolving the system of caste. As there was no difference of race, intermarriage between the later and the earlier invaders was permissible, but as the former probably consisted mainly of men, they would naturally commence by taking wives from the conquered tribes, giving none in return, for the very simple reason that they had none to give. The physical surroundings of the Punjab must at all times have precluded its invaders from bringing with them their women or children, and raiders do not usually carry much in the way of impedimenta.

There are also Kundewal Banias, in Bikaner, and there are Kundewal Brahmans. Wilson gives Kundewal, earnal, Oswal. Srimal as gachahas or gots of the Jains. (Works, I, page 345). For the Khandelwel of paragraph 35, chapter 111, page 135, super.

When an invading horde settled on the land it would thus find itself unable to secure wives of its own tribes, and a custom of taking wives from the conquered, and therefore inferior, tribes would soon grow up. This practice however would not involve loss of 'caste,' for the women, though of inferior status, were of the same race. Thus in the Punjab a hypergamous relation was easily established between the dominant warrior class, who represented the last wave of successful invasion, and the class which they had subdued. The former may well be represented by the modern Rajputs, the latter by the great cultivating castes. In the absence of race prejudices, social considerations had the field to them. selves, and the custom of hypergamy gradually developed into a social rule. The dominant tribes owing to their ownership of the land were wealthy enough to be able to observe the main social restrictions, avoidance of polyandry and to be able to observe the man social restrictions, avoidance of polyandry and widow re-marriage. The conquered tribes who formed the mass of the cultivating classes could not afford to be so scrupulous, and so remained socially inferior. The Hinduism of lower India appears however to have had considerable influence upon the development of the social system in the Punjab, as was indeed but natural, and in consequence the status groups, especially in the southeast Punjab, tended to form castes, in which the principle of endogamy prevailed to a certain extent. At this stage marriage with a woman of equal status was regarded as giving the children the fullest rights of succession, but marriage with a woman of somewhat lower status was also recognised as legal, though in this case the children followed the status of the mother and had only the right to a diminished share in the inheritance. As the caste system in lower India became more rigid, strict endogamy became the rule in the South-East of the Punjab, but it did not become an established social law in the Himalayan Area or in the Central and Western Punjab, except among the Khatris and other Hindu castes peculiarly subject to orthodox Hindu influences.

Territorial hypergamy.—Consistently with this theory of the origin of hypergamy we find that those fragments of the tribe which advanced furthest to the east, and presumably married most women of the subject races, were regarded as inferior to those which remained in the west and were not under that necessity. Hence arose the custom of taking, but never giving, brides to the eastward, which finds expression in the Rajput proverb, 'purab ki beti, pachham ka beta,' a daughter of the east, a son of the west.'

The position of the sacred clans.—The sanctity of the sacred clans or sections which are to be found in so many castes, prevents their marrying their daughters to the purely secular clans. This at first sight looks like a form of hypergamy, but there is, I think, a clear distinction. It is not the sacred clan will not give a daughter in marriage to a layman, but that the layman will not lay himself open to the pains and penalties of sacrilege by taking her in marriage. To receive the daughter of a sacred clan in marriage is equivalent to obtaining an acknowledgment of sanctity. Thus the Chela sept of the Sials in Jhang have recently obtained a Qoreshi girl in marriage and this implies that the Qoreshis acknowledge their claim to be considered a holy tribe.

Fiction.—Thus among the higher castes social status was the governing factor in their organization. Among the lower castes we find several other factors which render their organization even more intricate. In the first place the lower castes imitated, or attempted to imitate, the higher in their social system. The extent to which this sincerest flattery of the upper classes was carried appears in the tendency of the Nais to form groups like those of the Khatris, and in the observance by the Mohammadan Mirasis, who serve Hindu families, of the "four-got" rule. The Narra ilaqa of Rawalpindi is held by four dominant tribes of Pathans, and all the menial castes under them have adopted their customs, which are not those of the neighbouring tribes. The precise extent to which this imitation of the higher castes has modified the social system of the low castes is a point for further investigation, but an instance of it is to be found in the Jat system of makans which seem to be an imitation of the Rajput system (paragraphs 31 and 33 supra). But of all the instances available the Brahmans furnish the best illustration. The supremacy of the Brahman is one of those superstitions which die hard. It is asserted by the most recent

writers on caste, and will doubtless continue to be asserted so long as information is taken from Brahminical treatises on caste and actual facts are ignored. The Brahman is an umbra, whose status depends mainly on his client's (perhaps one should say his 'patron's ') position in the world. Between the Brahman of the Dhaighar-Lahoria Khatri and the Brahman of the Chuhra is a complete series of social grades.

Function.-Amongst the higher castes status is determined by the strictness with which certain social rules are observed, and by the avoidance of intermarriage with groups which violate those rules. Occupation is a secondary consideration, and a Rajput or Khatri need only avoid certain degrading trades and occupa-tions. But among the lower castes there are endless social distinctions based on differences of occupation. Thus the Ramdasia Chamar will not in with the Jatia or Mona who skin dead animals; the Bhakkar Qasai is superior to the Bhaglia because the latter sells the meat of all animals; the Sheikh Lohars are looked down upon as being beggars by profession; the Mirasi who does not sing with prostitutes will take a wife from those who do, but not give one in exchange.

Consistently with this we find no functional groups among the Khatris, Aroras or Banias, but among the Brahmans they are conspicuously important, and even in the castes of middle status they exist. Thus the Raoji Ahirs will not intermarry with other Ahirs, while the Gowala Ahirs are excluded from alliances because they sell milk. Similarly Gujars who send their women into the towns to sell milk cannot obtain wives from those who do not, and Arains who sell vegetables cannot intermarry with the Nain or Jatala sub-castes.

Thus imitation of the higher castes and function appear to be main factors in the organization of the lower castes, but there are other influences, such as religion, and descent, real or supposed. Thus the Rajput Bharbhunja or grainparcher will not intermarry with the Kanauji, Dhan Kath or Kaith sub-castes : the Bazigar have three endogamous sub-castes, Brahman, Jat and Mohammadan: the Jat Bharais do not intermarry with the Kalal, Mochi or Rangar Bharais: among the Mehra the Jabia looks down upon the Kanthiwal and Rawalia who eat jhatka: the Atri or original Telis are superior to the other Telis who are mere parvenus, and only Telis by occupation: the asl Mazhabi has a well-defined superiority over the more recent converts to Sikhism from among the Chuhras: and so on ad infinitum. There is no caste so low, and no calling so mean, but that its members find 'some other caste or calling to disdain.' So far we only know the broad social divisions among these lower castes, but it seems probable that among them are various minor degrees of social position. How far these, and the tendency to imitate the higher castes, lead to hypergamy and its various consequences I cannot say.

38. Endogamy.—From what has been said in the preceding paragraph it will, I think, be clear that the guiding principle of the Punjab social system is, hypergamy, within the tribe or caste, extending in a limited degree to hypergamy between the castes or, as I should prefer to call them, status-groups.

Writing in 1883 Mr. Denzil Ibbetson indeed said :- 'The law of hypergamy is, I believe, almost confined to the Kha-Punjab Census Report, 1833, Section 683. tris, and Hill Rajputs and Brahmans, all of whom are also endogamous as regards the caste. The law of isogamy necessarily governs the marriages of these three castes, since there is none higher in which to wed '. In the light of the additional information accumulated since 1883, I think these conclusions must be modified. The Hill Brahmans are not strictly endogamous, for among the Gaddis, one section intermarries with Khatris. The Hill Rajputs are hypergamous, as has been already shown. The Khatris in the south-west of the Punjab take Arora women to wife, and even, it would seem, 'marry' Brahman widows. Nevertheless for the greater part of these Provinces Mr. Ibbetson's conclusions still hold good, though I think hypergamy must be regarded as once a remarkably wide-spread institution. It is singularly unfortunate that we have no precise data to show the extent to which it now prevails. It must be borne in mind that we have been looking for instances of the custom, and, as so often happens in India when one looks for anything one finds a great deal of it, so that it would have been desirable to obtain some statistical data. It would, however, be a practical impossibility to obtain any such data, and we are obliged to fall back on general information, which appears to show that, as civilized ideas make headway, hypergamy gives place to endogamy, and that though it cannot be said that any caste is throughout these Provinces as yet strictly endogamous, the idea of hypergamy is becoming less tolerated year by year. Only one instance, (among the Kangra Brahmans), of a group abandoning endogamy for hypergamy has come to light.

- 39. Hypergamy and Female Infanticide.—It may be safely said that at some period or another hypergamy led to wholesale female infanticide, but for some centuries at least it is clear that the Punjab tribes have been undergoing a process of disintegration, so that now the lines between tribes and social groups do not coincide. As the tribe has increased in numbers, it has split up into various status-groups, sometimes into distinct castes. The result is that tribal statistics are of no value whatsoever for determining whether female infanticide is practised by any groups within a tribe. To take a concrete instance, we may assume that the Jats of Darbari status are under strong temptations to commit female infanticide, but it would not in practice be possible to obtain separate statistics for Jats of that status. In the first place there are several grades of Darbaris, and in the second place there are undoubtedly numerous villages and families which claim that status, or aspire to rise in the social scale, but whose claims are not admitted.
- 40. Exogamy.—The rule of exogamy is almost universal among Hindus and among some of the Hindu tribes converted to Muhammadanism, but it is subject to numerous modifications. There appears indeed to be no single rule of social custom which is not altered when circumstances necessitate some relaxation in its observance.

To take the most primitive people, the Kanets of the eastern hills, we find that the exogamous unit is the kumbha or khatta which is said to comprise about twelve generations: after the twelfth the kumbha is split up into two or more kumbhas. These units are grouped together in khels* but the khel does not seem to be endogamous.

The result is that in the Simla hills alone there are over 1,100 Kanet kumbhas each of which is said to be exogamous. Among the Kangra Rajputs the exogamous unit is not apparently fixed. The rule of exogamy, strictly speaking, forbids intermarriage between descendants of a common ancestor, however mythical or remote, and intermarriage between some Jat tribes is prohibited on that ground, but not so among others. It is indeed impossible to lay down any general rule,

Ferozeper Gasetteer, 1889, page 61.

Jats, 'the Sara intermarry with the other muhins (or sub-septs) showing that the got is practically too large and is beginning to sub-divide. This process will probably go further in time, for the Sidhus occupy so large an area of the cis-sulej country that, if they rigorously regarded the whole tribe as a single got, some of them would hardly be able to find a wife within a day's journey of their homes.'

The origin of the exogamous sections.—This is a question of great interest and I regret that my information on it is so meagre.

The chief factor in the creation of new sections appears to be abnormal births or births under peculiar circumstances. A typical instance is the case of Sibian Jats, of whom the legend runs that a Jat woman died enceinte and that a son was born at the burning-place (siwa). This son founded the tribe whose name is thus derived. Numerous other examples might be given, especially among the Khatris, and many of the differential customs of the sections are to be traced to the portents or miracles which attended the birth of their first ancestor.

Totemistic sections.—It is not easy to say definitiely if totemistic sections can be said to exist in the Punjab. A few instances have apparently survived among the Aroras, and there are possibly stray cases among the Jats of the south-eastern plains, the Gujars, Rajputs and other castes, even the Khatris, but the evidence is not conclusive for little but the names remain, the instances

Kanet khels:
Palashi, palash, a tree.
Pajaik, paja,
Kanesh, kanash,

of respect paid to the totem itself being few and uncertain. Amongst the Kanets of the Simla hills there are a few khels which have originated in some manifestais subsequently worshipped as an ancestor.

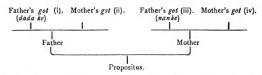

tion of divine favour by a tree, which is subsequently worshipped as an ancestor, its name being also adopted as the khel name.

Eponymous sections are very common among all castes, except perhaps the Jats. The eponym is usually a legendary hero, a warrior, or merely the founder of a village, indeed any conspicuous personality in the tribal annals. The sections of the lower castes, e.g., the Ghirths, are often named, like the als or families of the higher, from personal peculiarities of their founders.

The village nowhere appears to be an exogamous unit, though among the Kanets and Ghirths many septs take their names from villages, apparently in imitation of their Rajput over-lords, whose als are frequently named after villages just as the tribe bears a territorial designation.

All these seem to be but special applications of a general idea. The family is regarded as an unbroken chain of vitality, a succession of avatars, and any break in the chain starts a new series. When circumstances require the creation of new exogamous sections hardly any excuse is too trivial for the purpose, and so we find, among all castes, numerous family-names derived from personal peculiarities, nick-names, incidents humorous or tragic, often fanciful in the extreme. In the hills these families soon become exogamous units, but in the plains the process is slower and new gots are much less easily formed.

41. The prohibited degrees.—Amongst Hindus the commonest rule of exagany, though not the one always characteristic of the highest castes, is the one which may be called the four-got rule:—

When gots i—iv must be avoided in marriage we have the rule according to who had an an may not be married in the section of his father (which is also his own), in that of his father's mother, or those of his mother's father and mother. Beyond this kinship is no bar. In the Punjab this rule is subject to various modifications and extensions, according to circumstances. Examples of these have already been noted amongst the Khatris and the Brahmans. It is indeed impossible to lay down any general rule, whether we consider individual castes or the groups within a caste, but it may be stated that the observance of the four-got rule is easier, and therefore more common, among the lower castes than it is among the higher, as the following notes will show:—

In the Ambala District it is stated that the four-got rule is observed by the Chuhra, Bhanjra, Julaha, Ramdasia Chamar and Kalal castes, while the Agarwal Banias, Sikh Jats and Hindu Malis are content to avoid one, i.e., the father's got alone, and the Hindu Lohars only avoid three. In Jind some Jats avoid three gots, others only one. In Gujranwala the Brahmans appear to avoid only two pots, their own and that of the mother, that is, I understand, the mother's

[.] These four gots are also called the four angs, i.e., limbs or hodles, in Punjabi.

father's. So too, the Bishnois* are reported to avoid only these two gots, and the Mahtams (in Multan) may not marry in the maternal grandfather's got though whether they must avoid the mother's mother's got also is not stated. Thus the observance of the four-got rule depends not on caste or status but on the circumstances of each section. If the circle of matrimonial alliances is wide the rule is respected, but not otherwise. To such an extreme is this principle pushed that instances have occurred among the Bedis of marriage within the got. The position of the Bedis, described in paragraph 8 above, at once explains how this could occur, for repugnant as it might be to Hindu ideas to marry within the section, it would be a less evil to allow such a marriage than to give a girl of a sacred got to a man outside it.

In the Simla Hills, the rules remind us of the old Hindu rules, for it is stated of the higher castes that;

- they do not intermarry with families connected with theirs even in the seventh generation, and
- (ii) they do not intermarry with families connected with that of their maternal grandfather in the 3rd or 4th generation.

And the lower castes do not intermarry in families which are connected with them even in the fourth generation, yet Kolis, Shepherds, etc., may marry a maternal uncle's daughter. The vagueness with which the rules are stated points to uncertainty and laxity in their application.

42. An apparent extension of the rule of exogamy.—There is an apparent extension of the rule of exogamy, which appears to be wide-spread and of great antiquity, which prohibits marriage in a got in which a daughter or sister is married, (Khatri Gaddis in Kangra). This rule appears to find its widest extension in the Raiput system of thambas. Thus regarding the Tunwar Raiputs L. Thakur Das Dhawar, E.A.C., writes:—

"Girls may be given to the Mandahars, Chauhans, &c., but the idea is that the part of the country from which the Tunwars get their wives ought to be avoided. For this purpose the Tunwar villages are divided into thambas [pillars], for instance, the thamba of Lukhi comprises the villages of Lukhi, Chanarheri, Bhusthala and Jalberi: Pharal thamba includes those of Pharal, Bipur, Chandlana, Sudpur, Kathwa: Tangaur thamba has Tangaur, Kalsana, Dhakala.

To take an example, the Tunwar girls of Bhusthala are married in Rajaund to the Mandahar Rajputs; the Lukhi Rajputs cannot then take girls from Rajaund. Morcover, the bhanji (sister's daughter) and abhiti (daughter's daughter) are avoided. If it be found that the girl is descended, however remotely, from a Tunwar woman of the thamba she cannot be taken in marriage. To take a concrete example, a Bhusthala girl was married at Bahuna; her daughter was married at Baras; the Baras girl at Baragaun; the Baragaun girl was betrothed to a man in Lukhi and on this being discovered the Baragaun people raised objections and the nai came up to say that the alliance could not be completed; it has been broken off."

In this case the origin of the rule seems clear. There is a danger of marrying a woman who may be descended, through females, from a common ancestor. The number of gots amongst the Rajputs being few only the father's got need be avoided, but the thamba system appears to effectively prevent all risk of inter-breeding.†

43. Restrictions on marriage.—The main restriction on matrimony is undoubtedly the rule of exogamy, which, variable though it is, often embraces a very wide circle within which a bride cannot be looked for. Still exogamy is not the only obstacle, for amongst the Jats we find that hereditary feuds operate as a bar in several cases. Of these the most famous is that between the Dhillon and Bal: that between the Sindhus

Amritsar Gasetteer, pages 54: 53. and Pannus still exists, in spite of efforts to bring it to a close, as it causes inconvenience. The Kang and Khaire Jats in Amritsar are also at feud. The Deo will not intermarry with the Man probably for the same reason. The Randhawas appear to avoid marriage with

But according to another note they observe the four-got rule (Ferosepur). Speaking generally no single tement can be quoted from one account which is not contradicted in another.

[†] This rule appears to be distinct from the rule against taking a wife from the those in which one's father, grandfather or even great grandfather married. (Karnal Settlement Report, 1883, Section 189.)

Sistkot Gazetteer, pages 77-8.

In Sialkot there are similar Chahils. rules against intermarriage between certain Jat tribes, and there are doubtless many petty local feuds which operate as a bar. These feuds are incurable, because in most cases they originated in

the death of one of the tribe in an affray and the victim, having been canonized as a shahid or martyr, is now worshipped as a jathera or ancestor of his There are other causes which prevent intermarriage. Thus the Sikka-Bhiana were once Bári Khatris and one of them was to marry a Malhotra's daughter, but he died during the ceremony, before the hathlewa rite had been completed. So now Sikkas and Malhotras may not intermarry, smoke together, sit in the same chauka, or even cross a river in the same boat. In other words marriage between two sections is sometimes, owing to some untoward incident. tabu'd in perpetuity.

Spiritual relationship.—Speaking very generally spiritual relationship involves all the consequences of natural kinship (cf. paragraph 66 of Chapter Nima-nandi. Rama-nandi. exceptions to this rule. is as a caste have four sub-divisions and

in contracting marriage avoid their own got (apparently equivalent to sub-division), and also the kanthi* or group related to them as spiritual descendants of the same Guru.

44. The ages of marriage.—Speaking generally it may be said that the ages of betrothal and of marriage depend not on the caste, but on the social status of the parties within the caste, and that the higher their social position the lower is the age of betrothal and marriage. But this general statement must be qualified by two additions: (i) that hypergamy, resulting in difficulty in obtaining a suitable match for a daughter, often prevents her betrothal[till a com-

Hoshiarpur Cagetteer, page 36.

paratively advanced age, and (ii) that

among the higher classes who observe strict parda there is felt to be less necessity for early marriages, and even if an early betrothal is effected marriage does not take place till the girl has reached puberty or even later.

An important point to be considered in comparing the marriage data at each

MALES. FEMALES. Proportion of children under 10. 1881. 1901. 1901, 1881. All Religions Hindus 26:16 26-04 27:53 27'46 24'52 23'81 24'09 25.76 36.10 23'43 Muhammadans 39.16 ... 22'97 27'99 20'00

census is the relative numbers of the children in each sex in the population enumerated. In this case comparison with figures of 1891 is impossible, as in that year ages were recorded on a different principle to that

followed in 1901 and 1881, but comparison with the latter year shows that as far as children under ten are concerned there has been very little change in the constitution of the population. Hence we can usefully compare the data of 1881 and 1901 for the ages of

In this, as in many other matters, the tendency is for the lowest castes to

in the Himalayan area, and that married females under 10 are most numerous in that area, in the south-eastern districts and in Hoshiarpur and Jullundur. The important districts in which the number of married (and widowed) girls under 10 exceeds 80 in 10,000 females are given in the margin.

Between 10-15 the same districts, with a few additions, return over 400 girls married in 10,000 females.

Taking the two Provinces as a whole we find that only 340 girls are married

Females 10-15 married or widowed in 10,000 of all ages.

and 6 more widowed out

Married. Widowed. 6 Rohtak 415 495 463 462 Gurgaon Delhi 5 7 3 7 7 Karnal Juliunda Nabha *** 411 543 477 492 Jind Himalayan Area ••• Kangra Umballa 402 515 7 Hoshiarput

and 6 more widowed out of 10,000 females (all ages) before the age of 15. In the North-West Frontier Province the figures are only 126 and 4: while in the Native States they are 440 and 8, being much in excess of the British Territory (Punjab alone), 341 and 5.

I can suggest no explanation of this, but it is

Married and Wid	o—15.			
Natural Divisi	on.		Males.	Females.

worth noticing that of the Natural Divisions the most married males under 15 are returned in the Indo-Gangetic Plain West, i.e., by the South-East Districts: and the most married females by the Himslayan Area, i.e., by the most backward tract. In

the former area it appears that marriage is "infant" on both sides, whereas in the Himalayas the disparity of ages is greater.

Taking the figures by religions it will be found that child marriage is essentially a Hindu, rather than a Sikh or Mohammadan

Hindus 507
Sikhs 344

Subsidiary Table XI, Chapter IV.

practice. Indeed if the term Sikh were used in a consistent way we should

probably find the Sikh figures much closer to the Mohammadan.

Lastly child marriage also tends, apparently, to disappear. The number of married girls under 15 is

			Married girls under 1 in 10,000 females.		
			1901.	1881.	
Hindus		***	 498 340 226	579 432 318

Mohammadans	***	***	 226	318	

now 340 in 10,000 females, as against 432 in 1881. This decrease is found in all the three main religions, but is most conspicuous among the Sikhs and Mohammadans. Further discussion of the data

would appear futile. In the first place, as mr. maciagan pointed indicated in Chapter IV of this report, our age-data are untrustworthy, and the data for girls of a marriageable age or married are particularly so. But even if we assumed their substantial accuracy certain factors prevent our basing any general conclusions on them. We find, for instance, 3,751 unmarried girls under 15 in 10,000 Mohammadan females, while the Hindus have 3,213 and the Sikhs only 3,039. If we could be certain that female infanticide, in any degree, did not intervene to reduce the number of girls we could conclude that Hindus and Sikhs married their girls at an early age. But that assumption could hardly be made, and so in comparing the data we do not know if the basis of comparison is the same in all cases. If we could be certain that there was no unnatural interference with the numbers of the female population we should, from the data, conclude that the Hindu or Sikh had less difficulty in marrying a daughter than exactly the opposite is the case. Precisely the same difficulty meets us when we come to consider the figures for any given caste. If we find that caste A has a large number of girls unmarried, while caste B has very few, we cannot infer that caste A has a restricted circle of possible matrimonial alliances while B has no difficulty in disposing of its daughters. When in England we find that the females considerably out-number the males we can draw certain conclusions because the balance of the sexes is not artificially disturbed. In the Punjab at least we can, unhappily, draw no conclusions.

45. The universality of marriage.-The above remarks apply to our

Number married in 10,000 of the same sex.

		Mal	es.	Females.

figures for marriage generally, and not merely to our figures for married persons under 10 or 15. Taking the figures as they stand we find that the proportion of married persons is lower in all religions than it was in 1891, early marriages doubtless account-

ing for the higher ratio of married persons among Hindus as compared with the Mohammadans. But as regards Sikhs it cannot be said that this explanation holds good, for in their case the high ratio is clearly due to the low proportion of unmarried girls. In other words marriage is more general among the females who survive in the case of the Sikhs, but it is unfortunately a reasonable suspicion that fewer girls live to be married, than among Mohammadans.

We may consider this from another point of view. Taking the figures for

				Bachelors over 15.	Spinsters over 15.

exist among Hindus. Considering the low proportion of girls under 15 we should have expected to find very few spinsters over 15, as brides ought to be a premium. Instead of this we find them at a distinct of the count, as compared with

the Hindus. (Comparison of these figures with the Mohammadan ratio would be useless, as the latter figures are affected by certain considerations.) The conclusion is that the difficulties in effecting marriages among Sikhs are much more serious than they are among the mass of the Hindus. The Sikhs, however, comprise comparatively few of the lower castes, and thus if we could compare the data for the higher Hindu castes with those of the Sikhs we should find, probably, that the data were much the same in both religions, the obstacles being due to social rules in each case.

THE CLASSIFICATION OF CASTE.

The attempt to classify castes in the order of their social precedence was, as will be seen from the foregoing pages, doomed to failure from the outset. We know far too little of the complex organization of the Punjab castes to be able, at present, to classify them in any systematic or instructive way. The complications within the castes have their natural counterpart in the chaotic and uncertain relations between the different castes,

46. The social relations between castes.—Looking to the complicated social gradations which exist within each caste it will be readily understood that between the castes the social relations are divergent and fluctuating to a degree.

No doubt Hindu society may be divided, just as Mohammadan society is divided, into two main grades, the clean and the unclean, but beyond that no social classification of the castes appears to be possible. To take an instance:—
The position of the Hindu Nai is at first sight a test. The Nai is often said to be the lowest caste from which Hindus of good status may take water, but he is as often said to be the caste at which they draw the line. Puzzling as this contradiction is, I think the clue lies in the following note by Mr. T. P. Ellis who, writing from Attock, says:—

"The custom of Attock and of the north of the Rawalpindi District is that all Hindus, even Brahmans and Khatris, can take water and food, kachchhi and pakki, from every one professing Hinduism, no matter what his caste, provided he does not defile himself by performing services to a dead body and receiving the clothes of a dead person. That custom is the real test, locally, of defilement, e.g., a Brahman can take food from a Nai even, and frequently employs one as a cook, provided he does not accept the clothes and other belongings of a dead person. (The rule in Pindigheb is different.)"

That is to say the caste does not defile, but the status or occupation within the caste. To this it may be objected that as Attock is the ultima Thule of Hinduism observances in that part would be lax. Possibly this is so, but in that case I am unable to explain the following variations in usage. In Gurgaon and Rohtak the rule is that all Hindus can take water or pakki food from Hindu Nais: in Ambala, Ihelum, and in Jhang, they will take water and food, both pakki and kachehhi from them: but in the latter District Khatris, Aroras and Bhatias, and in Kangra all Hindus of good status, refuse to take either food or water from a Nai.

A very interesting question, and one of some practical importance as bearing on the recruitment of the Ambulance Bearer Corps, is whether a Hindu of good caste may take water from a Mohammadan bhishti. In Rohtak agriculturists,

even Rajputs, will do so: but in Gurgaon they will only do so from his mashak, not from an earthen vessel: yet, in Kangra, Hoshiarpur, Rawalpindi and Ambala, it is said, no Hindu will take water from a Mohammadan, nor will he, as a rule, do so in Jhang: the Jat Sikhs of Ferozepur have however no such prejudice and will take water brought (in their own vessels), on donkeys by Mohammadans, because necessity compels them to do so. Probably the explanation of these contradictory accounts is that the Hindu Jhinwars, Dhinwars, or Machhis are too few in some parts to admit of caste prejudices, if they exist, being indulged. It would however be going too far to say that there are no such prejudices, for Brahmans object to water taken from a mashak, or drawn by a Mohammadan (Gurgaon): while certain Rajputs of high standing, who wear the janeo, will only take kachchhi food from Brahmans or Rajputs of their own status (Rohtak): Brahmans of a high class again object to food cooked by a Brahman of lower status (Mianwali): and the Acharj, the Sawani and the Bhat are too unclean, or too unlucky, for any caste to take food from their hands.

47. The Janeo.—In other Provinces of India the Hindu castes appear to be organized on a remarkable system, which is almost ideal in its symmetry. Society is divided into two great groups, (i) the twice-born castes which wear the sacred thread, and (ii) all other castes. At the head of the first group stands the Brahman.

In the Punjab this idyllic system is not to be found. The twice-born castes do not all wear the sacred thread, while on the other hand it is often worn by those whom orthodox Hinduism would regard as Sudras and not as twice-born. The Brahman may be sacerdotally superior, but socially he is often the lowest of the low; whatever his status every Brahman appears to wear the janeo, and it is assumed even by the Dakotra, Bojhru and Bhat Brahmans.

Among the higher castes the janeo is generally worn, but the practice, especially in the towns, is said to be dying out. This is also the case with Raiputs and Kaiaths. On the other hand the Tank Sunars generally wear it, and so occasionally do members of the Mair sub-caste. The Lobanas wear it and are very particular about it, retaining it till death. The Nais who minister to castes which wear the janeo also wear it, and though strictly speaking only authorized to wear a janeo with one agra or fold, commonly wear one with the usual two agras. The usages indeed connected with the janeo are exceedingly diverse; but in some form or other they are found in almost all the castes which stands within the pale of Hinduism.

48. Local variations in status.—The status of a caste varies greatly with its locality. This will be apparent from the notes on the two castes, the Lobanas and Mahtams, which follow.

District.

The Lobanas.—In the Punjab this caste is found in the Districts noted in the margin and in several of the southwestern Districts. The caste has however a different status in various parts of the Punjab, and is by

no means homogeneous. We may distinguish three groups :--

- i. Musla Lobanas, mostly found north of the Sutlej.
- ii. The Lobanas of Ludhiana.
- iii. The Lobanas of Bahawalpur.

338

i. The Musla Lobanas are so-called by group ii. Most accounts represent these Lobanas as having 11 sections or gats but the names of these are variously stated*. In Gujrat the names specified are as follows:—

Sections in Gujrat.

- i. Ajrawat, (or Ghotra in Kangra).
- ii. Datla (? laugher), also called Makhan-Shahi.
- iii. Pilia, (painted with saffron).
- Parwal, Padwal, Badwalia, Porwal, (? from padwa,—the janeo ceremony).

ix. Mathaun. x. Wamowal.

xi. Narowal.

v. Khasarya. vi. Gojlia. vii. Guajr.

viii. Tatra or Tadra.

The first five of these sections appear in nearly every account of the caste. The remaining six are probably ats or sub-septs, locally exogamous, resembling those found in Central India, or possibly they are merely family or nicknames. Of the eleven sections specified the first six are also found in Central India, apparently as endogamous groups split up into numerous exogamous divisions. So far no traces of this system have been found in the Punjab.

In the sub-montane tracts of Sialkot and Gujrat the Ajrawat look down upon the Khasaryas, and the story goes that once the latter said that even the bullocks of the Ajrawat would get married, they, had so many daughters. The Ajrawat also look on the Gujar section as inferior.

ii. This group is confined to the Bet tract of Ludhiana, where it holds seven small villages, and shares in three others. It disavows ail connection with the Musla Lobanas and has the following gots:—

Dagnawat. Bartia, Udiana. Balthia. Sukiana. Barnawat.

This group is distinguished by having a fixed bride-price, Rs. 120 being paid if the bride-groom is a child, Rs. 140, if he is an adult, to the girl's father. They practise karewa. A curious custom on the Holi is accounted for in a variant of the Prahlad legend. All are Sikhs.

iii. In Bahawalpur the caste is thus grouped :-

Hypergamous group { i. Ramana. ii. Udana. } do not intermarrry. iii. Gharnawat. iv. Chihot. } intermarry.

In Bahawalpur the Lobanas claim to be Rathor, and many having been returned under that designation: their numbers (1,262) in that State have been under-stated. They have a strong panchayat system, and are mainly Sikhs. The legend about their origin is that a Rahtor had a son born with long moustaches and so he was called lobana or "cricket."

339

Sections: in Kangra, i, iii and vii as above, and Daina, Kalwana, Ghara, Dholthal, Dahgra, Belia, Khera, Mochia, Bhunia, Padorgaya.

Section: —in Hoshiarpur, i, ii, iii, iv, v and vii as above, and Kakanya, Lulia, Ghara, Kalawans, Bhagtaana.
Sections: —in Ludhinan, Pilia, Laldia, Jatre. Khanna-Kupra, Garba, Datla or Gujre, Parwal-Nagri. Of these the Garba rank highest.

The Lobanas appear to have been settled in the south-west Punjab by Diwan Sawan Mal, and those who own land hold deeds of grant from him. Their principal occupation is however rope-making. Hindus do not associate with them for fear of the Mohammadans, who object to their eating wild-pig! (Multani Glossary, page 212). In Sialkot and Gujrat the tribe stands much higher, and appears to be intermarrying with other agricultural tribes. This however does not necessarily imply a great rise in the social scale, for in Ferozepur the Baurias are intermarrying with Jats. Widow re-marriage is tolerated, but, in Gujrat, the children of such marriages have a lower status.

The Lobana traditions would derive them from Rathor and Chaunan Rajputs, or from Gaur Brahmans, as in Central India.

49. The Mahtons and Mahtams.—There can, I think, be little doubt as to the identity of these two names. The status of the tribe varies however in a marked degree. In the Hoshiarpur and Jullundur Districts the tribe holds a group of 22 villages, one got alone, the Tiach, holding a barah or circle of twelve hamlets. The Mahtons in Jullundur, according to Mr. D. G. Barkeley, have 30 gots, including Manhas, Khattis, (a new got formed from it), Chauhan, Kharaudh, Majariya, Khuthan and Puri. In this tract the Mahton is of fairly good status, probably somewhat lower than the lowest Jat tribes, but not very far below them. In the Amritsar District, on the other hand, Mr. J. A. Grant described them as a degraded class, living on all kinds of garbage—if they can get no better food,—and principally engaged in thieving and cultivation. In Lahore they stand no higher, though they are fair cultivators. In Ferozepur

Hoshiarpur (Gazetteer	***	***	***	***	Page	60
Amritsar	**	***	***	***	***	99	59
Lahore	**	***	***	***	***	**	108
Ferozepur	12	***	***	***	***	09	67
Montgomery	99	***	***	***	***	Pr	87

Mr. E. B. Francis ranked them with, or even below, the Baurias, the Mahtam using a noose of muni rope (van) instead of a

leather one (bawar). In Montgomery they appear to hold a slightly better position, but in Multan they are not highly esteemed.

The litigious, quarrelsome character of the Mahtani is remarked by most observers, as is his dark complexion, short stature, and peculiar ugliness. On the other hand they are stoutly made (Montgomery), and of strongly marked individuality, (Hoshiarpur). As a rule, they claim a Rajput origin, but in Multan they say they came from Sindh. This is in accord with the earliest information on the subject which represents them as migrating from the east.

50. The tabulation of Caste.—This subject has been exhaustively discussed in former Census Reports, and as the present figures were tabulated on the lines laid down therein it does not appear necessary to recapitulate the details here. Appended to Subsidiary Table II of this Chapter is a series of footnotes which give the more important data.

The chief uncertainty attaches to the statistics of caste on the Frontier. As an illustration of the conditions there prevailing I may quote the case of the Ali Khel section of the Orakzais. All Ali Khels are weavers, and refuse to give daughters to persons who are not weavers, or who do not know some other useful trade. But weaving is not looked down upon, in fact it is regarded as an honourable profession.

This fact throws some light on the conditions in Peshawar described by Captain O'Brien in the Peshawar District Census Report. In that District many non-agricultural classes such a Mochis, Lohars, etc., endeavoured to get themselves returned as Pathan or Awan. Doubtless in many cases they succeeded in so doing, but there was some justification for the entries, for it is remarked that many Pathans related to owners in the village have come down to black-smith's work, and so there were many entries like Pathan-Lohar, Pathan-Tarkhan, etc. Clearly these entries were correct, for the occupations mentioned involved no loss of caste, there being on the Frontier no 'caste' to lose. And as a Pathan

does not lose status by becoming a weaver or even a cotton-cleaner, we may plausibly conjecture that he does not cease to be a Pathan because he turns carpenter.

Nevertheless it is clear that the figures for Pathans must be read in the light of these facts. For example the Pathan Tanazai is really a Mirasi, the Kanazai a Naddaf or cotton-carder, and the Pathan Shahi Khel are in reality a menial clan which lives by winnowing grain, etc., but which refuses to touch filth or intermarry with Chuhras, and so was, correctly enough, not tabulated as Chuhra, but separately. Precisely the same conditions obtain in the case of the Awans, of whom many have taken to menial occupations, but who do not regard themselves as included in the menial castes.

On the other hand the figures for Pathans appear to include many who should not have been so classed. For example, Pathan Tanaoli was taken to mean a Pathan of Tanawal, but the entry seems to simply mean Tanaoli, and Captain O'Brien points out that Jats, Awans and even Kashmiris in a Pathan tract soon become Pathan Jats, Awans, etc. But all Pathan tribes include numerous affiliated septs of Sayads, aboriginal Tirahis and others, and if all but true Pathans were to be eliminated in tabulation I am afraid that the number of Pathans would be diminished almost to vanishing point. It would indeed be impossible to draw any line between clans which had become fully affiliated and those which are still undergoing that process.

The conditions in Peshawar are paralleled by those in the South-West of the Phunjab, for in Bahawalpur many of the Bhattis, Sipals, Rans and Khokhars once of Rajput status, are now dyers, many Bhattis, Somras, Chauhans, etc., are iron-smiths or carpenters, and some Khajjis are also khatiks or tanners, while weaving and shoe-making are pursued by various tribes, including even Sayads and Kalhoras.

51. The Variations in Caste.—The variations in the numbers of certain castes are sometimes very difficult to explain, especially in the case of those

which return small numbers, for a change in the designation of a small caste or tribe in a single village may largely affect the percentages of variation. We may explain the continued decrease in number of the Aquaris by the decay of the salt industry in Rohtak and Gurgaon, but it does not appear why the Ahirs should have increased 14 per cent. in 1881—91 and only 4 per cent. in 1891—1901. If our figures are to be trusted the Arains have increased 26 per cent. since 1881, 12 or 13 per cent. in each decade, but clearly their numbers have been swollen either by differences in the entries made, or by conversions of Sainis and Malis to Islam.

As a rule the larger the caste the more does its increase approach the normal rate of increase in the total population, but there are exceptions. Thus the Ods and Beldars have increased 58.5 per cent. since 1881, while the Dummas have decreased nearly 12 per cent. since that year. The only explanation possible is that the occupational caste and the actual occupation are by no means one and the same thing, and that at each census caste and occupation are confused, but in varying degrees. Again among the higher castes fashion causes constant changes in designation, so that the Sansi Jat of 1891 becomes a Bhatti of 1901, and so on. More practical objects are also kept in view as the following extract from the Peshawar Census Report shows:—

"The jest of the country side is against the Kaka Khel, descendants of a Pathan Khattak saint named Kaka Sahib, who have taken the trouble to work out a false genealogical tree proving themselves to be Syads, and who are now trying to repudiate this and call themselves Pathans again for Land Alienation purposes. They are entered under Mians, Syads and Pathans, and should be Pathan Khattaks."

APPENDIX.

The Khatri caste-terminology.

The vagueness of the terms in use for "exogamous section," "endogamous" or "hypergamous group" is a serious obstacle to a clear understand-

ing of the organization of the Punjab castes. Indeed there appears to be no vernacular word which invariably and consistently denotes "exogamous section," and generally speaking there is no word for "endogamous group," much less for "hypergamous group," though sometimes we find a word loosely used to denote the latter. Thus in Peshawar

Peshawar Customary Law, page vil. denote the tratter, the groups are called the Brahman kuls are given as Panjzati, Athzati, Bahri, Bunjahi and Muhial. The Khatri kuls are Bahri, Bunjahi and Khokharan, while the Mahajans are said to have two kuls, Bhatiya (7 Bhatia) and Bhagant, but a third, the Aroras is added. In this last case kul appears to mean "caste."

There can, I think, be hardly any doubt that the terms Bari* and Bunjahi mean simply 12 and 52. Bari or the 12, and Bunjahi or the 52, sections at once call to mind the tribal collocations of villages known as Barah and Baraen. Tribes too with 12 sections are not uncommon, while the 108 sections of the Chhota Sarin remind us of the 108 offerings used in propitiatory rites. These numbers then are probably only imaginary, but if those groups ever comprised 12, 52 and 108 sections, the caste must have been organised on a non-genealogical basis.

But within the Bari group and within the Khokharain sub-group of the Bunjahi are groups which also bear designations denoting numbers with the affix-ghar or-zati.

These are: - Dhai-ghar

Char-ghar,	Char-zati.
Panj-ghar.	Panj-zati.
Chhe-ghar.	Chhe-zati.
Bara-ghar.	Bara-zati,

These terms require some comment. In the first place ghar and sati seem to be used indiscriminately, though Dhai-ghar is alone in use, not Dhai-zat. The term dhai (2½) ghar (house) is usually explained thus:—

The first four sections, Kapur, Khanna, Malhotra and Kakkar, only marry inter se and as the whole of the father's section must be avoided and the mother's kin to the extent of half her section, there remain only 2\frac{1}{2} sections from which a bride can be taken.

Another explanation is that the Seth, Malhotra and Khanna take wives from the Kapur, but do not give them daughters in return (Patiala), and that the Kapur are thus inferior to the three sections, which are called dhai, because Khanna means 'half,' This is hardly tenable because Kapur often heads the list.†

The real explanation seems to be that the number 3 is so unlucky that it cannot be used. The Jats have also $2\frac{1}{2}$ chief or original sections, so too have the Gujars, and $2\frac{1}{2}$ is unlucky in witchcraft and in charms. When 3 holes are bored in the ears and nose of a child, they are spoken of as $2\frac{1}{2}$, "dhai," not as three. However this may be, it seems clear from the following extracts that the terms denote the number of sections into which the group may give a daughter in marriage. Thus Captain O'Brien, writing of the Peshawar Khatris, says:—

" The Bari are subdivided into-

(a) Dhaighar, namely :-

(1)	Kapur		•••		•••	i
(2)	Khanna		•••		***	ii
(3)	Malhotra,	also	called	Mehr.	a	iii
(4)	Kakkar					iv

Most of my correspondents, however, spell the word 'Bahri,' and in the case of the Bahri Brahmans one of them says they are so called as living outside the towns.

[†] A third explanation is that the Dhai-ghar are so called because they halted 29 cer from Delhi.

A fourth makes them 5 half sections, but does not specify the names of the half-sections. Still it is curious that the Dhai-ghar have 5 Brahmin sections who minister to them.

(b)	Chaharghar, name	ly :—		
	(1) Kapur	***	•••	
	(2) Dhon	***	•••	٧
	(3) Malhotra o	r Mehra	***	
	(4) Wohra	•••		vi
(6)	Chheghar, namely	:-		
	(1) Talwar	•••	•••	vii
	(2) Chopra and	a few famili	es of Kaka	rs, viii
(d)	Baraghar, namely :	-		
	(1) Malhotra	***	***	
	(2) Kapur	***		
	(3) Wohra	•••	***	
	(4) Saighal	***	•••	ix
	(5) Tannan	•••	***	

(6) Mahndra

The Dhaighars receive girls from all the other Bari clans, but give their girls only among Dhaighar with the further limitation that the Dhaighar man may not marry into his mother's got.

Chaharghar men take from Chheghar, and Baraghar, but give only to the other Chaharghar sections, and to Dhaighars.

Baraghars take girls from the other Baraghar sections, and give to all the above.

It is only possible to find out if a Kapur is a Dhaighar or Chaharghar or a Baraghar by putting that question to him, there being no separate name for a Dhaighar or Charghar or Baraghar Kapur.

Another version of the Peshawar Khatris gives Seth instead of Kakkar as a Dhaighar caste, and this is as in Ibbetson paragraph 540, and it will be noticed that there are only 11 sub-castes all told in my previous list. This version masses Kapur, Mehra, Kakkar, Dhon, Tannar, Talwar, Mahndra, Wohra, Chopra, all as Chahar—making no mention of the subdivision into Chheghar and Baraghar."

And again L. Paira Ram, E. A. C., writes of the Gujrat Khatris :-

"The first four sections (of the Bari), 1 Kapur, 2 Khanna, 3 Malhotra, 4 Kakkar, are either Dhaighar, Charghar or Baraghar.

That is to say some Kapurs, etc., are superior and of pure blood, and are called Dhaighar because they have two and-a-half houses to intermarry with. No one can marry in the section of his father, and of the remaining three the mother's parents and their relatives must be avoided; so that a girl and a boy have only two and-a-half sections to marry in. Some of the Kapurs, etc., having found difficulty in getting matches amongst the Dhaighar took wives from the eight lower, but continued to give daughters within their own four sections. These are called Charghars. Others not only took girls from the eight lower, but also gave them their own daughters, and these became Baraghars."

There are obvious difficulties in both explanations. In the latter it is a little difficult to see what the difference is between the Dhaighar and the Chargarh, for the latter, who continued to give daughters within their own four sectiors, would have to avoid their own got or section, and the mother's near relations, leaving only 'two and a half' sections, so that they too would be Dhaighar.

Captain O'Brien's account is more intelligible. No doubt the Chaharghar Kapur has at first sight 5 sections. Khanna, Malhotra, Kakkar, Dhaun and Wohra into which he may give a daughter, his own got being avoided. If however we assume that the mother's got also is avoided there remain but four, and the term Charghar becomes quite intelligible. Similarly the Chheghar have 6 sections, vis.:—Kapur, Khanna, Malhotra, Kakkar, Dhaun and Wohra, "of superior status, into which they can give daughters. Whether this explanation be

^{*}Because they gave to the 8 lower, as well as to the 4 higher, i.e., to 12 in all.

correct or not it is clear (i) that the terms Dhaighar, Charghar, etc., do not mean that those groups consist of (2\frac{1}{2}\text{ or }) 3, 4, etc., sections, and (ii) that they do not mean that a man of each group can only take a wife from that number of sections, for the Bari group may take wives from the Bunjahis who have numerous sections. It appears then that each of the families of the Bari group bears, without regard to their sections, a title which denotes that it may only give daughters to 3, 4, 5, 6 or all 12 sections. That these titles have now become mere conventional designations, denoting status within the group, may be plausibly conjectured, and this would account for the fact that it is most usual to say that the Dhaighar group comprises the Khanna, * Kapur, Malhotra and Seth-Kakkar sections. It would also explain the facts as reported from Delhi,† where the Khokhara are said to be thus divided:—

· ···· · · · · · · · · · · · · · · · ·	ato para to se tiles	aaca.	
1. Chadda. 2. Sohni. 3. Anand. 4. Bhasin.	Dhaighar.	6. Kohli. 7. Sethi. 8. Dehri. 9. Sabbarwal.	Charghar.

And it is stated that:—"The superior clans among them, viz., the Dhaighars, can marry their sons in Charghars, but they must always give their daughters to Dhaighars." This certainly looks as if Dhaighar and Charghar had lost their original significance and acquired a purely conventional meaning.

I have said that the affixes ghar and sali seem to be used indiscriminately, but I am by no means certain that this is the case. Amongst the Khatris and Brahmans, sat is used as equivalent to "section", got, and bons is often used with a similar meaning, as in (apparently) Asth-bans. Originally, it may be, sati or-bans denoted a group of so many section, e.g. panj-sati may have denoted "a group of 5 sections", while-ghar, as an affix, had a different meaning and denoted the status, s.e., the size of the circle into which a daughter could be married.

The word dhama is used for the status-groups, (Dhaighar, etc.) of the Khatris in Rawalpindi, thama being used of the exogamous groups of the Khokharan Khatris. I do not know if the words are the same. Possibly Dharan in the words are the same of the same of the words are the same.

Notes on Gurkhas, Vansittart, page 51.

man or Dhaman simply means the dhamas, in Gujrat. The word thama may be the same as thamba or thapa which is in common use among the Rajputs of Kamal for an exogamous group. Tham is also found in Nipal, there it appears to equal 'tribe.'

Section.

Status.

1. Kapur, Dhair, Chhe, or Baraghar,

2. Mahotra, Dhair, or Baraghar,

3. Mahotra, Barar, or Dhaighar,

4. Kakkar, Dhair, Chhe, or Baraghar,

5. Dhaun, Chaeghar,

6. Wohra, Char, or Baraghar,

7. Chopra

8. Talwar

10. Sahgal

11. Mahi

12. Tannan

13. Tannan

14. Tannan

These status-groups are called thamas, or dhama, and each dhama takes the daughters of the one just below it, but does not give its daughters in return. These Dhaighar take from Charghar, Charghar from the charghar, and Baraghar, and Baraghar from Bunjah, Marriage is you among the Dhaighar and Chahghar, but exchanges (not sales) are allowed among the Baraghar. Among the Bunjahis exchanges and sales are common.

[·] Consistently with this I find the Bari Khatris of Pipdigheb Tahsil are thus ranked:-

[†] The Khokhran have precisely the same groups in Hazara, omitting Dehri.

The Gurungs (Gurkhas in Nipal) have two groups, Charjat, with some 50-60 clans, and Solabjat with about as many. Vansiltart does not explain these terms.

^{*} Kakkezai were included in Kalal in 1891. See page 306 of Census Report, 1891.

[†] In 1881 and 1891 Rababi was included in Mirasi, and also Kamachi in 1891. See page 310 of Census Report of 1891.

[†] Kamangars were included in Tarkhans in 1891. See page 318 of Census Report of 1891. 4 These are kindred castes. Liinti appears to partly include Rangres in 1881, see section 643 of Census Report of 1881.

Salqalgir was included in Lohar in 1891. See page 309 of Census Report of 1891.
† Includes Chúrigar (1,446) in 1881.
† Shoragar was included in Nungar in 1891. See page 311 of Census Report, 1891.
† Sincludes Swaff (3,447).
† Careshis were included in Nungar in 1891. See page 316 of Census Report of 1891.
† Qureshis were included and Pachada retuined as separate castes and excludes Rajput Dbúod in 1881.
† Includes Sagni (231) in 1881.
† Includes Sarara (4,426) in 1881.

Nore.—The figures in this Sub-Table have been calculated from the data in Table XIV of Volume II and are therefore for British Territory (both Provinces) only,

CHAPTER IX.

OCCUPATION.

I. The nature of the figures.-The difficulties of obtaining a correct return of occupations are great in most countries, and in India, where the Census enumeration is effected by a half-educated agency they appear to be well-nigh insuperable. The instructions issued contained, as it was inevitable they should contain, several subtle distinctions, which it was impossible to make the enumerating staff understand. Consider for a moment the confusion of thought which commonly exists regarding caste and occupation. The ordinary Jat, if asked his caste, will as often as not reply zamindar or 'cultivator' even when serving in the Army, and it is certain that in most cases the enumerators recorded a Chura or 'Khak-rob', as a sweeper by occupation without more ado, because it is obviously the business of a sweeper to sweep, and further questions as to his occupation would have been superfluous. On the other hand, the educated mind, especially the legal intellect, found in the instructions ample scope for subjecting the authorities, not omitting the hapless Provincial Superintendent, to a severe cross-examination. For instance, our instructions required the entry of the 'occupation' or 'means of subsistence', and a favourite conundrum was 'what should be recorded in the case of a Government official with a large private income and a small salary?' Should he be shown as living on the private income or the salary? Clearly in such a case the right course was to record the answer given, though perhaps on a future occasion it would be best to ask first for the occupation and only record the means of subsistence in the case of those who have no occupation. Another favourite question was 'how is a receiver of stolen goods to be recorded?' Obviously that profession is rarely, if ever, advertized, and in this, as in so many cases, it is a question whether a palpably incorrect answer is to be recorded, or whether the answer should be ignored and the enumerator's finding of fact returned. Clearly in such a case the only practicable course is to accept a man's reply, even though it may be notoriously or demonstrably incorrect.

Subsidiary occupation .- Profiting by the experience of former censuses the instructions provided two columns for each actual worker-one to show his principal occupation, and another to show his subsidiary occupation, if any. 'Subsidiary' was translated, and, I think, correctly, by imdadi or auxiliary, and this term did not, as a general rule, cause any difficulty, but many cases arose in which it was exceedingly difficult to say how a dependant who was also an actual worker in that he followed a subsidiary occupation should be shown. For example, if a boy is dependent on his father, a cultivator, for his subsistence, but tends his father's cattle, it would be hardly correct to show him as an actual worker, and enter his principal occupation as cattle-grazing; and such an entry would have led to a reductio ad absurdum, for probably over 50 per cent, of the boys of the agricultural classes do some kind of work, though they are actually dependants and ought to be so shown in our Tables. In such cases that the test is, I think, whether anything is directly earned and contributed to the family resources. Thus, if a lad herded the village cattle and earnt something, in money or in kind, he should be deemed an actual worker; whereas if he only herds those of his family, his position is like that of the wife who cooks her husband's food, and who, though she thus contributes in a sense to his earnings. remains dependant on him. Nevertheless in a country in which the family, rather than the individual, is the social unit cases must often arise in which it is impossible to say where the line between actual workers and dependants should be drawn, and perhaps, (though one shrinks from even hinting at making the instructions more complicated), it would be possible to have a separate column for 'dependants following a specified auxiliary occupation' to meet such cases as the one described.

Dependants.—Following the precedent of 1891 those who were not actual workers, but who were entirely dependent on others for maintenance, were entered as dependants, but with this improvement that they were shown in a

separate column, so that the schedule was intelligible in itself, and thus the return of dependants is, or ought to be, more accurate than it would have been in 1891, had dependants been tabulated from the record.

In 1891, however, dependants, though recorded, were not tabulated as returned, it being thought that a more correct impression of the working population would be obtained by an age tabula-

tion than by the distinction of dependants and others made by the enumerators. It was, as Mr. Maclagan says, a subject of regret that this decision was arrived at in 1891, for a visit to the carpet factories, at Amritsar, shows that there is no limit of age for actual workers, and gives one the impression that only young boys, often mere children, are or can be employed in the manufacture of carpets. Whether it is because adults in India lose the faculty of distinguishing shades of colour or because child-labour is cheaper, I cannot say, but the fact remains that a large proportion of the actual workers in the manufacture of carpets, shawls, etc., in the large towns are well under 15 years of age. On this occasion, however, dependants have been tabulated according to the entries recorded, and this, though it prevents any real comparison with the figures of 1891, should make the present statistics of more value. Various other difficulties which arose in making the entries of dependants may be briefly touched upon here. It was frequently difficult, and some times impossible, to make enumera-tors understand the difference between 'subsidiary' and 'dependant,' and so, to meet our wishes, a good many filled up all the three columns and returned people as both actual workers, with a subsidiary occupation, and as dependants. Such entries, however, gave little real difficulty in tabulation, as the age and sex entries were a practical guide, women and children in arms being rarely clerks or cultivating tenants. Again, in many cases dependants could not specify the occupation of the absent father or husband on whom they were dependant, and this was usually the case with women whose husbands were in Africa or Eastern Asia, for in such cases correspondence appears to be limited to remittances and the occupation was vaguely returned as 'service', though in many cases it must be trade or labour of some kind.

2. The Classification of Occupations.—For the benefit of the uninitiated in any be as well to explain the system on which occupations have heen classified in compling Table XV of Volume II. First, occupations are divided into eight Classes, each class being sub-divided into orders, thus:—

ORDER. CLASS. i. Administration. ii. Defence. A. Government iii. Foreign and Feudatory State service. B. Pasture and Agri- 5 iv. Provision and care of Live Stock. culture. v. Agriculture. C. Personal service ... } vi. Personal, Household and Sanitary service. vii. Food and drink, etc. viii. Light, firing and forage. ix. Buildings. x. Vehicles and vessels. xi. Supplementary requirements. xii. Textile Fabrics and dress. D. (i) preparation and supply of material ? substances by hand. xiii. Metals and Precious stones. xiv. Glass, Pottery and stoneware. xv. Wood, Cane and leaves, etc. xvi. Drugs, dyes, gums, etc. xvii. Leather, trans- f xviii. Commerce. E. Commerce, xix. Transport and storage. port and storage. xx. Learned and artistic professions. F. Profession xxi. Sport and amusements. G. Unskilled Labour ... \ xxiii. Unskilled Labour. H. Independent ... | xxiv. Independent of work.

The orders are further sub-divided into sub-orders, and the latter again into groups of one or more occupations.

3. General distribution by occupation.—Taking the total population of these Provinces it is seen that just on 58 per cent. of the population is directly

dependent on agriculture, including pasture, while only 19:37 per cent. are em-

ployed in the preparation and supply of material substances. Comparison with the data of 1891 is made in the margin and briefly the differences may be explained thus:—

Punjab Census Report, 1892, § 275.

A. Government.—The numbers of the population in Government service now 564,720 as against 603,305 in 1891, a decrease of 64 per cent. This is due to the fact that in 1891 a vast number of village menials and others in Ludhiana and Nabha were included in 'other village servants,' and so classified as in Government service. But on this occasion the figures probably underestimate the number of menials in Government employ, for it appears that the enumerators in many cases entered service (mulasimat) without further details, so that many such menials have been shown under 'personal services' (group 68) in consequence. Probably on a future occasion the instructions to enumerators on this point should be amended.

The Service of Local and Municipal bodies is now returned by 30,013

	District	1	LOCAL SERVICE.*

s now returned by 30,013 souls as against 20,761 in 1891, an increase of 44.5 per cent., the most noticeable increases being in the marginally noted Districts. It is not easy to explain these increases. The development of the colonized areas in Jhang and the transfer of Tahsil Thanesar to Karnal go far to explain the figures for

In Gujrat the figures are 1,323 in 1901, 203 in 1891,—abviously due to misclassification.

a misclassification. those Districts, but assuming that the classification was accurate both in 1901 and 1891, one would have expected a decrease in Hissar and elsewhere. Doubtless there is a great tendency for Local Bodies to increase their establishments, but possibly many of their employés were classified as Government servants 10 years ago when the distinction was less understood.

B. Pasture and Agriculture combined show an increase of 61 per cent, which is a little less than the increase of 68 per cent. in the general population. This is fully accounted for by the tendency to develope industries. Agriculture alone shows a slightly higher increase of 6'4 per cent., but the increase would have been greater had not 'agricultural labourers' decreased considerably, for taking land-owners and tenants alone, we have now 14,770,000 souls, including dependants, as against 13,330,000 in 1891, an increase of 10'8 per cent. in these two occupations. This increase is significant of the development of canals and the colonization of uncultivated tracts in the past decade. Canals call for general labour rather than agricultural, and this probably explains in part the marked increase in general labourers (832,689 as against 371,940 in 1891, an increase of 124 per cent.) and possibly of sweepers and scavengers (762,784 as

against 521,314 in 1891, an increase of 46 per cent.), for many labourers being sweepers by caste have doubtless been so returned. It is worth noting that the Chenab Colony returns over 110,000 Chuhras, of whom the great majority have doubtless been employed on the field-work necessitated in bringing that area under cultivation.

Landholders and Tenants.—An attempt was made to obtain data classified in some detail of the numbers of landholders and tenants. The variety of tenures is great and it would have been of interest to obtain precise data, but it is doubtful whether we have been successful. For example, superior proprietors have only been returned in the Chenab Colony, though they are found in many Districts and, the Colony, Jhelum and Rohtak Districts return considerable numbers of tenants 'unspecified,' no distinction between occupancy tenants and those holding at will or on lease having been observed. Still the returns are of some interest and value as they stand. The yeomen (5,160), peasants (117,117), and capitalists (223) are returned in the Chenab Colony only, as are the 34,122 tenants under them. The malguszars are returned only in the States of Mandi and Chamba, in which, and in other Hill States, the peasantry hold their lands rather as perpetual tenants of the State than as full owners.

Out of the 14,775,983 souls directly dependent on agriculture over 62 per cent. are owners, and of these the vast majority are cultivating owners. There are also 57,000 mortgages of whom 41,000 are cultivating holders, and these figures are doubtless below the mark. Occupancy tenants who sub-let have been shown amongst land-holders (No. 36), and number over 62,000. Cultivating occupancy tenants number over 1,281,000.

Tenants-at-will number some 3,144,000 of whom 52,000 sub-let their land and an important class of cultivators are the partners in cultivation who number 369,000, and are found mainly in Karnal, Ambala, Ludhiana, Ferozepur and Patiala.

C. Personal services show a marked increase of 15.6 per cent. due, as ex-

		18	ig1.	1901.

50 per cent. due, as explained above, to the correct classification of village menials. That this
explanation is correct is
also deducible from the
marginal figures, which
show that in several Districts our figures for
sweepers by caste are now
in closer accord with
those for sweepers by
occupation, though I am
inclined to think that the

present figures have gone to an extreme and that the Chuhra-Chamar is more often a general labourer than a sweeper or scavenger, or that at least he combines both functions.

Classes D and E include the preparation and supply of material substances, (including both the necessities of life and supplementary requirements, or luxuries), and commerce, transport and storage, It is no doubt impossible to distinguish, in any country and more especially in India, between the man who prepares a commodity and the man who supplies it, but the latter is a trader as well as an artizan, and it is therefore inevitable that these two classes should overlap. Still greater is the overlapping within the orders in class D, which includes all the artizan population: for example the blacksmith is often a carpenter and if asked his trade will reply 'Lohar-Tarkhan,' so that it is a matter of pure chance whether he be returned as a blacksmith in group 328 or as a carpenter in group 344. And again he may be employed, temporarily, as a builder, and thus appear in group 163, or in a carriage factory and so appear in group 171, and thus affect the totals of the orders. The ordinary mistri will repair one's

roof, furniture or dog-cart, all equally badly it is true, and it is impossible to say in which order he should be returned. In short the division of labour has not yet been carried for enough to enable us to classify the industrial population on European lines. The result is that the attempt to compare the figures of 1891 with those of the recent census is a hopeless one and the conclusions suggested by the following notes have very little value.

E. Under Commerce there is a marked increase, but under Artizans a corre-

Group.	1901.	1891.
No. 83, grocers and general shopkeepers, of 18.1 No. 124 of 1001 No. 255, general shopkeepers, of 1891 No. 398 of 1901	28,401 343,221	495,034 50,874
Total	371,622	\$45,908

ut under Artizans a corresponding decrease, due to a difference in classification. In 1891 general shopkeepers were returned in two groups (No. 83 in sub-order 19, Order VII, Food and Drink and No. 255, in sub-order 56, Order XVIII, Commerce), and the majority appear

to have been then included in the former, whereas the present return includes them all in one group (No. 398 in Order XVIII).

It would seem that there is a greatly increased tendency for the cultivating classes, and those dependent on them, to sell their produce at each harvest (it is possibly already pledged) to the village shopkeeper and in turn to buy their daily supply of him. As a result, grain-dealers have increased from 36,274 in 1891 to 339,852 persons in 1901. Salt-dealers have also risen, from 11,787 to 19,034. Adding these figures to those in the inset above it will be found that shopkeepers of all classes show an apparent increase of 23 per cent.

D. Artizans.—The detailed figures for certain important classes of artizans

of interest. It is noticeable that goldsmiths have apparently decreased by more than one-fifth, but the decrease does not seem to be real, many more dealers in gold and silver and wire-drawers having been returned than in 1891. How far this difference in the returns represents a tendency to specialize in different given in the margin indicate a tendency for the

cate a tendency for the trade in the precious metals to centralize in Amritsar and Ludhiana, and to decay in the neighbouring Districts. The uncertainty in the relative value of the precious metals has not been favourable to the petty sunar in out-lying tracts, remote from the great marts, and the wealthier members of the trade appear to have

found it profitable to migrate to the markets on the line of rail.

Cotton-weaving now gives employment or support for less than a million

Districts favourably situated for the supply of wool showing most increase. Two or three carpet factories have been started at Batala in Gurdaspur, and the trade in Amritsar is flourishing. On the other hand, this industry has almost dis-

appeared in most of the Districts in which it was carried on on a small scale.

In Order XI, supplementary requirements, there has been a marked increase from 56,590 persons to 226,098, owing chiefly to the inclusion of a new group, 'Plough and other agricultural implement-makers,' which is very numerous, amounting to 140,025 souls.

Luxuries .- As a rule, the figures show marked increases, but the numbers

	1901.	1891.

remain very small for a population of over twenty

millions. 582 persons are sufficient to supply these Provinces with musical instruments, but probably most native instruments are home-made. Yet 23,129 souls live by making bangles. The falling

of in furniture-makers points to some error in classification.

In drugs and dyes there is a remarkable falling of-amounting to 44 per cent.—chemists and druggists having fallen from 22,835 in 1891 to 7,208, and dye-workers and sellers from 10,762 to 7,436. The increasing use of imported aniline dyes fully accounts for the latter, but it is not so easy to explain the

G. Unskilled Labour, not agricultural.—This now forms a separate class, having been included in 1891 in Indefinite and Independent. In 1891 the number returned under this head was 458,279, but it is now 900,439, an increase of 96'5 per cent. Clearly large numbers of agricultural labourers, or persons so classified in 1891, have now been returned as general labourers, but the increase may well be in great part a real one, many field labourers having taken to eath-work on canals.

Mendicants show a slight increase of 13,634 souls. The decrease in religi-

_		1901.	1891.

Total		819,087	805,453

mendicants is apparently not real, for beggars are rare in India and probably nearly all should be classed as religious.

H. Means of subsistence independent of occupation .- This now forms a distinct class. The numbers show a great increase over the corresponding suborders of 1801, being now 884,066 persons as against 675,290 in that year, an increase of 31 per cent. The main increase is under rent, shares, etc. (not being land), but educational endowments and allowances from relatives, etc., also show a marked increase. Though special efforts were made to obtain the data, only 4,198 persons are returned as dependent on remittances from emigrants in and out of India. The figures must be much under the mark, even if only those entirely dependent on such allowances have been so returned.

4. Subsidiary occupations,-The subsidiary occupations having been recorded it was thought advisable to attempt to obtain some data to show what were the principal pursuits

Subsidiary Table 1X.

of those who also follow

certain subsidiary occupations. I use the term, 'pursuits' because the principal occupations for which data were tabulated were not classified according to orders and sub-orders as in Table XV of Volume II and the other Subsidiary Tables of this chapter, each occupation shown in Subsidiary Table IX, being tabulated separately.

The data obtained have a certain value, though they are probably incomplete. For example, I am fairly certain that more than three men who are reservists are village servants, or vice versá. The figures show that, as might have been anticipated, the data for principal occupations alone do not give an adequate idea of the complexity of occupation in these Provinces. Thus 28,723 land-owners are also village servants, but to these should be added 3,313 village

servants who are also land. owners, and by this prosome interesting cess results are obtained, as the marginal figures show. For instance 11,685 Government officials appear as owning land, but conversely 8,530 land-owners are also Government officials, so that 20,215 represents the total number of officials who possess land. It is a little amusing to see 1,595 mendi-

cants returned as owning land, and 2,365 land-owners recorded as also pursuing begging as a subsidiary occupation, but in India such entries are perfectly natural, and doubtless 3,960 males do combine the two functions of religious mendicancy and property holding,-indeed the numbers are probably under-

If we take the double set of figures together we find that very much the same

classes combine the tenancy of land with other occupations. Further the relation of each set of figures to the other is not without interest, for whereas amongst the artizans we find 54,693 who subordinate cultivation their handicrast, there are no less than 32,047 who return their handicraft as subsidiary to their agricul-

tural pursuits, a sign of the tendency among the better classes of the artizan castes to acquire land and take to cultivation. The figures also throw some 364

light on the condition of the menial castes, for in addition to 34,257 with whom cultivation is a subsidiary occupation, 17,615, or half as many again, have returned agriculture as their principal means of livelihood. These data tend to show that among the artizan and menial classes many are taking to agriculture and abandoning their hereditary occupations, but full light could only have been thrown on this point by tabulating the occupations of the castes con-cerned. This it was decided should not be done for any of the castes in these Provinces as no such movement as is indicated by the figures discussed above was believed to exist. We cannot indeed say that those figures prove that the lower castes are abandoning their traditional occupations for agriculture, because we have no data for 1891 with which to compare them, and further the menial and artizan castes have to a considerable extent held land as owners or occupancy tenants from a long period, but the numbers now shown to subordinate their hereditary pursuits to agriculture do, I think, show that these classes are obtaining a firm footing in the ranks of the agriculturists. It should further be pointed out that labourers, whether field labourers or earth-work and general labourers, are not included in the figures for menials. The numbers among them who are either owners or tenants of land amount to 22,107.

As a general rule, if we put aside agriculture, occupations are not often

money-lending go together, but the figures given here must be well

below the mark, for most traders lend money and are reluctant to let the fact be recorded in official documents.

as they stand however it is found that Government servants have returned relatively most partially agriculturists, the Professions and Commerce coming next, while General Labour is lowest of all, as one might

expect. The proportions in each class depend probably in the main on the classes from which the occupations are recruited, but it may be conceded that money acquired in a profession, in trade or by artizans is most usually invested in land in some form or other. In the case of Government service so many officials are now taken from the landed classes that one is surprised to find that the percentage of partially agriculturists is only 11'2 per cent., and the more so in that many. Government officials invest their savings in land.

6. Proportions of the actual workers and dependents.—Out of the total population of 26,842,611 souls, in these Provinces, 16,592,510, or nearly 62 per cent., are returned as dependents. This is a high ratio of non-workers and it is clear that the line between those who are entirely dependent and those who pursue some subsidiary occupation but are virtually dependent on the principal workers has not been strictly drawn. Nevertheless, I think that the figures represent an approximation to the truth, for it must be borne in mind that the bulk of the Mohammadan population observe parda, more or less rigid, and there would be, in consequence, a tendency to return the great majority of the

Mohammadan women as dependants, even if they contributed directly by their earnings to the support of the household. We have not separate figures for religions or castes in the case of occupations, and so it is impossible to say whether relatively more dependants were returned among Mohammadans than among Sikhs or Hindus, but it is common knowledge that the Mohammadan peasantry cannot employ their women in the field as the Hindus and Sikhs do, and that the Rajputs, as a class, would lose status if their women were so employed, while the Jats, if not Mohammadans, owe much of their prosperity to the help their women give in the lighter tasks connected which agriculture.

The percentage of actual workers in each class is given in the margin. a, those

have nearly as many.

These figures appear to show that many who follow subsidiary occupations connected with trade and agriculture have been returned as dependants. In the other cases the proportions are very much what we should expect, there being comparatively few dependent on pensioners, prisoners and mendicants, on unskilled labourers, or on servants.

7. The occupations of women.-Nothing impresses Indian visitors to Europe more than the extent to which women are employed, and there is no greater obstacle to progress in India than the prejudice against the rational employment of women in India in occupations to which they are naturally adapted. A great source of national wealth is thus lost to the country. This

fact is illustrated by our returns for women Subsidiary Table VIII. are only employed, in relatively large

numbers, in the indefinite and disreputable ocupations. Out of females in these Provinces only 1,309,182 or 10'6 per cent. are actual workers and their employments are practically confined to personal and household services, the preparation of food and drink, light and firing, dress and general labour including earth-work,in other words to menial occupations. Of these again 495,794 or over a third are females engaged in agriculture, of whom the majority are owners or tenants of land. Of some 196,000 engaged in personal services three-fourths are scavengers or water-carriers: of 145,000 employed in preparing food 84,000 grind corn: and of 160,000 who make textile fabrics and dress, 68,000 are cottonweavers, engaged in the hand industry. In other words, women when employed at all or allowed to earn a living must work at the most degrading and roughest occupations.

8. Local Distribution of occupations.—Taking the purely agricultural population, and excluding the small pastoral element, the figures show but little change since 1891. Subsidiary Table II.

As then the agricultural population in the Native States is nearly two-thirds (66 per cent.) of the total, while in British Territory it is only 55 per cent. In the Himalayan States it exceeds 80 per cent, and is high in Kurram, Kangra, Bannu, Hazara and Hissar, where it exceeds 70 per cent. In only one District does it fall below 40,

and in only four others below 45 per cent. In the Districts of the North-West Dry Area the Agri-cultural population bears the same ratio to the whole as it does in the Indo-Gangetic Plain, but in the former case the industrial element in the

cities, and in the latter the pastoral element, is somewhat higher.

The range of diversity in the industrial population is not very marked, rising from 3.8 per cent. in Kurram, to 31.6 in Jhang. It only fails to reach 10

per cent. in the remote mostly Native States, noted in the margin. In no Native States, except Kotla, does the ratio amount to 20 per cent. but in 15 British Districts it is 20 per cent. or over as the marginal figures show. It is not a little remarkable that in the Districts of Jhang and Multan, and to a less degree in Shahpur and Jhelum, the proportion of the industrial population should be so high. Multan

returned a still higher percentage of artizans (29'4 per cent.) in 1891.

 Occupations in Cities.—The difference between Indian and European conditions is strikingly illustrated by the figures for workers in the cities, Delhi,

Total population—

Actual workers, male 217,095

", female 29,469

Dependents 327,404

Lahore and Amritsar, less than 30,000 women, or 12 per cent. of the actual workers, being actual

workers, whereas in London there are 719,331 females to 1,399,969 males (of ten yeards) engaged in occupations, equivalent to 34 per cent. of the actual workers. Facts like these throw light on the causes of India's poverty.

It is also characteristic of the stage of industrial development in the Punjab that the city populations do not differ much in their elements from the total population. The total numbers supported by the learned and artistic professions only amount to 6'3 of the city populations. Government Officials are, however, relatively more numerous in the cities, especially in Lahore, and the numbers are somewhat below the mark, as at the time of the census many were on tour. How very far industries are from being centralized in the cities may be gathered from the fact that textile fabrics and dress only employ and support 72,317 souls or 12'5 of their populations; and cotton industries only 22,409 or less than 4 per cent.

10. The organization of industry.—Under the old social system of these Provinces every tract, and to a certain extent, every village, was a self-contained economic unit, in which were produced the simple manufactures required by the community. This system facilitated the development of a caste system based on hereditary occupation. Below the land-holding tribe, and subject to its authority, were the various sacerdotal, artizan and menial classes, which have more or less crystallized into castes, and these classes were, economically and socially, closely dependent on the dominant tribes who owned the land and controlled its allotment. These castes were all more or less servile and were paid by a share of the produce of the soil, or more rarely by fixed allowances in kind, cash payments being probably a very recent innovation. But the better classes among them were also assigned land for maintenance, and this system was especially fostered by the priestly groups, so much so that according to Pathan custom all Sayads, all descendants of saints, and all descendants of mullahs of reputation for learning or sanctity are entitled to grants of free land called seri,

the amount of the grant varying according to the degree of inherited sanctity. In precisely the same way to Brahmans were given grants of land (sasan), varying in extent from a group of villages conferred by the State, to a mere plot granted by the village community or a section of it. The possession of such a grant conferred a high social status on the grantee, so that the sasani or beneficed Brahman of the hills stands higher than those who hold no such grants. Similar grants were also made to any religious personage or to a shrine or temple and by an extension of the same principle to men of the artizan classes. These grants were alike in character and conferred no absolute right of ownership, the grantee having an inherent power to resume a grant if the purposes for which it was made were not fulfilled, but the grants varied in degree, those to shrines or sacred personages to all intents and purposes conferring a permanent right of possession hardly distinguishable from ownership, and those made to menials being wholly precarious. The tenures thus conferred, whatever their precise legal nature, enabled the servile classes to eke out a living by cultivation, but it left them menials, or artizans, or priests as before, and custom forbade them to change their abode without the consent of the land-holders. And if the dominant tribe migrated its dependent castes went with it, the Brahmans of the tribe, its Bhats, Doms, and other menials migrating also, a custom which even now may be found in operation in many cases in the Chenab Colony.

Thus each tribe, at least, if not each village, was, economically, a watertight compartment, self-contained and independent of the outside world for the necessaries of life, but for commodities not obtainable within its own borders it depended on foreign sources of supply and on the outside castes, such as the Lubanas, or salt traders, who formed no part of the tribal or village community. Thus there have never arisen, in this part of India, any great industries. Foreign trade, necessarily confined to the few large towns, was limited to superfluities or luxuries, and such industries as existed were necessarily on a small scale. Further, inasmuch as each community was absolutely independent as far as necessaries were concerned, the few industries which supplied luxuries never became firmly rooted and have succumbed at the first breath of competition. Everywhere in our official literature one reads of struggling industries in the small towns, though fostered by intermittent official encouragement, dying of inanition. seem obvious enough. Everything essential can be, and for the most is, made in the village or locality, so that there never is a demand for imported articles of ordinary make, those made by the village artizans, however inferior in quality, satisfying all requirements. In good seasons there is some demand for articles of a better class, but when times are bad that demand ceases, and the industry languishes. Thus the village industries alone are firmly established. If the crop is short, every one from the landlord to the Chuhra, receives a diminished share, but small as the share may be it is always forthcoming, whereas in the towns the artizan is the first to suffer in times of scarcity, and if the scarcity is prolonged the urban industries are extinguished. But if, on the one hand, these industries are precarious, the village industries are firmly established and will probably die hard in the face of the increasing competition which menaces them. Before touching on this point, I may note briefly another result of the weakness of the industrial position in the towns.

The system of advances.—In the villages the artizans and menials are by custom share-holders in the community, in spite of their dependence on the landholding tribes, but in the towns the artizan classes are entirely dependent on the capitalist classes without a customary right to share in the trade profits as compensation, and this unsatisfactory condition of things arises out of the system of advances to operatives which prevails on a very large scale, and especially in the cities. This system appears to be, generally, as old as the industries themselves, and it has grown with their growth until it has become a serious menace to their progress. Thus in the case of the carpet-weaving and several other industries at Amritsar, it is said that each master artizan, who has workmen under him, owes Rs. 300 to 1,000 to his employer. This debt is called balance or bagi and when an artizan leaves one employer for another, the latter must, by the custom of the trade, refund the outstanding advance to the former and thus 368

IX.

himself become the artizan's creditor. In addition to this outstanding baqi, other advances are from time to time made to the artizan. These are called kharch and money due for work done is credited to this kharch, anything over and above the sum advanced being credited to the baqi, though in practice it is alleged by the capitalists themselves that on the kharch account the balance is usually against the workman, whose baqi in consequence is constantly increasing. It is admitted that the baqi constitutes an irredeemable debt, which the workman can never hope to liquidate and which thus renders him liable for life-long service to the capitalist, although interest is not charged on the amount outstanding. The system then precludes any attempt on the part of the operative to improve their skill or efficiency, for increased earnings would merely go to liquidate the baqi. It is small wonder if under this system several minor industries have decaved.

II. Domestic and Factory Industries.—An attempt has been made to obtain data showing the proportions of the actual workers in each industry who Sabbidiary Table IV. are employed in factories

or work at their own homes. Such data are exceedingly difficult to obtain because it is hardly possible to define a factory. Thus in Gujrat a tendency is noted for artizans such as carpenters, blacksmiths and weavers, to combine, four or five working together at one shop, and, though such shops hardly constitute factories, it is impossible to say how far the workers in them have been returned as workers in factories. On the other hand, a comparison with the numbers of operatives returned in the Factories Report for 1900 shows that the Census figures are as a whole below the mark, for the Factory returns show 20,584 as the average number of operatives in 1900 per diem, whereas only 16,472 are shown as actual workers in factories on March 1st, 1901, in the Census Table (XV of Volume II). The deficiency is most marked in Lahore which had 5,823 operatives in 1900, while only 1,363 were enumerated at the Census. To a great extent this discrepancy is probably due to the fact that in the cold weather of 1900-01 the cotton-ginning factories generally were closed down or working half time owing to a short supply of cotton, but as the Census returns include factories of all kinds, whether within the scope of the Act or not, one would have expected them to show larger numbers employed in factories.

It may be that the rules were misinterpreted, 'factories' being taken to mean 'factories in which machinery is used, 'and the fact that only 118 persons are returned as employed in the carpet-factories in Amritsar City lends colour to this view.

However this may be, it is clear that in these Provinces the factory-system is in its infancy. In certain industries, such as watch-making, toys, musical instruments, furniture, harness, gold-working and others no factory-workers are returned. In the case of woollen manufactures also the return is blank, although the Egerton Mills at Dhariwal employ some 800 hands. This is due to the absence of a separate heading for workers in woollen mills, who have been included in group No. 251, Order XII.

In other industries the numbers returned as factory-workers are small in comparison with the total employed, except in petty industries like aerated waters and ice-factories, gas and water works and others, which could only be carried on by machinery in factories: and in Railway workshops. Even in the cotton-spinning, weaving and other industries connected with cotton, out of 461,825 actual workers only 2.713 or 58 per cent are employed in factories.

12. The present condition of village industries.—Bearing in mind that the only industries carried on in villages are those which supply the barest necessities in the way of agricultural implements, household utensils and clothing, all of rough, though serviceable quality, it may be said that they have as yet been little affected by the establishment of factories or by foreign competition.

Cloth-making.—The branch of industry chiefly affected is that of cottonginning, numerous factories having been erected of late years. Thus at the close of 1900 there were 132 factories (within the scope of the Factories Act) in these Provinces, of which 76 were cotton-ginning, cleaning, or pressing factories, and 5 were cotton-spinning, etc., mills. Nevertheless, the general opinion is that the manufacture of country cloth in villages has not yet been seriously affected because hand-made cloth is both cheaper and more durable than the machine-made article, in which the fibre is damaged in the process of manufacture. Indeed, there is still a considerable export of country cloth from Tahsil Pind Dadan Khan in Jhelum to the frontier Districts and Kashmir: and from Sialkot to those Districts, the North-West Provinces and even to Bengal; and in these Districts at least the industry is holding its own. Generally speaking, the use of imported piecegoods is confined to the towns, and to the better classes among the villagers, but at most some 5 per cent. of the total population appear to use imported cloth.

There is however a tendency to centralize the manufacture of cloth in the towns, machine-made thread being used and the cloth made by weavers employed by capitalists, but so far this system has met with slight success. Indeed in Khanpur in the Hoshiarpur District the tendency is for the industry to leave the town and become scattered in the neighbouring villages. The Depute Commissioner of Jhelum (Mr. P. D. Agnew) thinks there is very little chance of industries being centralized in towns so long as the octroi system effectually handicaps any such movement. This bears out the remarks made in paragraph 22 of Chapter I, at page 21 supra.

The use of machine-made thread is, it may be noted, sufficiently extensive to seriously diminish the amount which women can earn by spinning, an industry on which many of them, among the poorer classes, are virtually dependent.

Sugar-making.—The old wooden presses, each requiring nine men and four bullocks to keep it going, have been mostly replaced by the iron presses, made chiefly at Nahan, which can be worked by two men and a single bullock. The iron press is said to turn out black sugar with a flavour of machine-oil, and it injures the fibre of the canes so much that they cannot be used for mats, ropes, etc., as they used to be, but, in spite of these drawbacks, the cheapness of the new machines has undoubtedly saved sugar-making from extinction as a village industry. Imported sugar has indeed largely replaced the country-made article, although it is objected that the former contains bone-dust and at a recent fair in Rohtak the confectioners who used European sugar were turned out by the people.

13. The industrial future.-Thus in competition with village industries the factory-system is at present making but little head-way, and other causes operate against its rapid development. Capital has hitherto found a more profitable, or a more tempting investment in exploiting the agriculturist and the result has been to divert capital from its natural field, the development of staple industries. The absence of technical skill, which can only be acquired by technical education, also appears to be a serious obstacle, and attempts on the part of native capitalists to employ European skilled labour have not met with much success, owing to our national failing. It is indeed significant that nearly all the machinery of the mills run by native capital is in the charge of half-trained native workmen, who are found to be, in the long run, more efficient than trained European mechanics. On the other hand, the inherent incapacity to combine for a common object, characteristic of native society, has rendered the Joint Stock Company system less successful than it might have been, and success is only assured in cases where the company consists of men of the same caste or rather of the same section of a caste. Of this there is an excellent illustration at Amritsar in the Piece-goods Market recently constructed by a syndicate, whose members are almost exclusively Banias of the Nauria got, and it may be conjectured that in the future the Joint-Stock Company system will to a great extent be grafted on to the caste organization. Nevertheless, within certain limits, considerable powers of organization and combination have been displayed and the management of many large native concerns contrasts favourably with that of

The industry in and around this town has been affected by foreign competition,

European firms. It may then be anticipated with some confidence that industrial development will progress slowly on characteristic lines to the eventual exclusion of European capital and personnel. With improved technical instruction and the setting free of capital for its legitimate functions, it seems inevitable that industries will be concentrated more and more in the large towns and cities, but the process is not likely to be rapid.

nyt. Caste and occupation.—There do not appear to be in these Provinces any movements under which the great occupational castes are abandoning their hereditary functions, and it was therefore determined not to tabulate the occupations of any castes. It may indeed be doubted if such tabulation, unless carried out in very minute detail, would throw much light on the slow, and almost imperceptible, but unceasing movements by which tribes rise or fall in the social scale, owing to a change of occupation which entails, sooner or later, a change of caste. To a certain extent this process goes amongst the Hindus, for a Chamar who aspires to rise may take to weaving and soon become a Julaha, while the lower groups in the Bania 'caste' were undoubtedly promoted Chamars. It is among the Mohammadans however that the process is most active. Converts of the lowest castes commence as Dindars, Musallis, etc., but if they abandon degrading occupations rise to Sheikhs or Khojas. Thus to a great extent caste is dependent on occupation and the tabulation of the occupations of a given caste would probably prove that fact and nothing more.

At the same time the variability of caste is not to be lost sight of. Under modern conditions the higher castes in both religions are losing their dominant position and are being compelled by circumstances to adopt professions or occupations which they would have despised two or three generations ago. Thus amongst Hindus the Drahmans have lost prestige: 'their intellectual progress is not marked, nor are they generally wealthy, and in consequence they are deserting priestly learning for practical wisdom,' which appears to mean that when they cannot live by begging they take service as cooks and domestic servants. But this does not apply to the Muhial. The Khatris also, except, in the Rawalpindi District, are, by general consent, losing ground in wealth and influence, and for this their social system is apparently responsible. Nor is our administrative system favourable to the Rajputs, who are only saved from rapid demoralization by the fact that numbers enlist in the Indian Army.

On the other hand, the 'middle-classes' and upper artizan castes of Hindus are making great advances not only in material wealth, but in social position and influence. The Aroras, Banias, Dhusars, Mahajans, Bhabras, and Suds may be mentioned as instances, while the Jats, both Hindu and Sikh, have generally speaking advanced both in wealth and education. Of the artizans the Tarkhans are almost rising to the status of a professional caste, as they acquire qualifications as engineers. Probably no other caste has made such strides in the past twenty years as this. The Kalals or as they may now be termed Ahluwalias are also advancing rapidly.

Amongst Mohammadans there is unhappily little to record, but retrogression in education, influence and wealth. The only exceptions are a few isolated communities like the Khojas of Bhera, and the Mohammadan Punjabis (Sheikhs) in Delhi, while the Swatis of Mansehra, the Tarkhelis of Haripur, in Hazara and the Sheikhs of Attock are said to have taken advantage of educational facilities open to them. Elsewhere in the frontier Districts Government schools are denounced by the multahs as disseminators of heresy, and cis-Indus the Mohammadans confine the education of the young to religious doctrines, just as their literary activity is limited to matters of religion. Similar remarks apply to the cultivating classes, which are generally retrograde in everything save numbers, though to this there are exceptions, as the Mohammadans of Gurdaspur and Pathankot Tahsils seem to be out-pacing the Hindus in education, and in the south-east the Meos and Minas are improving in this respect. The butchers in this latter part advanced in wealth, but in nothing else, in the periods of scarcity.

15. The Criminal Classes.—Taking British Territory alone it is found that there were on March 1st, 1901, 14,098 convicted prisoners in the jails of these Provinces.

To this population the Jats and Pathans alone contributed upwards of one-

third, the former having 3,753 and the latter 2,097 convicts in the jails on that date. No other caste contributes anything like so many as these, the Rajputs with 1,034 and the Biloches with 730 coming next. In proportion to their numbers and wealth the Awans (427), Brahmans (269), Aroras (340), Khatris (257), Sayads (316), Sheikhs (280), and Qureshis (62), supply considerable numbers of convicts. Of the tribes generally designated criminal the Sansis (with 242), and Baurias (106) alone furnish large

numbers, the Harnis only returning there the Mahtums, 35, the Pakhiwaras 32, and the Minas 18. The quasi-criminal castes are also but poorly represented, for the Nats and Bazigars only return 42, the Bangalis 3, the Gandhilas 3, the Kanchans 2, the Kikans 5, and the Kanjars 13. On the other hand the low castes such as the Chuhras, 545 (excluding 132 Chamars), Jhiwars 103, Julahas 204, Kumhars 109, Mirasis 83, Machhis (142), and Kashmiris 181, furnish substantial numbers, considering their size, to the jail population. The figures are rather a surprise and tend perhaps to show that, as far detected crime goes, the more well-to-do castes are not always the least criminal.

Homicide.-Out of 1,050 persons convicted of murder well over 50 per

murder well over 50 per cent. (574) were Pathans or Jats, the former alone accounting for nearly two-fifths of the number. The Biloch comes next, but a long way behind, and he is hardly as homicidal in his tendencies as the Sayad or the Awan.

Dacoity.—Out of 241 convicts for dacoity the Jats account for 70.

Further particulars would not perhaps be of general interest, but the detailed return has been forwarded for record in the Police Department.

16. The Criminal Tribes.—In order to obtain an accurate estimate of the figures for the tribes registered under the Criminal Tribes Act it was arranged that the police authorities should compile a statement showing the numbers of the absentees of each tribe according to the Police records on the night of March 1st, 1901. The results are tabulated below. The figures are not, however, absolutely correct for children under 12 are not registered and therefore, if absent on the census night were always returned as absentees. A separate return of vagrant tribes (criminal and non-criminal) was also prepared and submitted to Government.

Statement showing the numbers, as returned in the Census of 1901, of Registered Criminal Tribes.

APPENDIX.

THE COST OF THE CENSUS.

On the present occasion two accounts of Census Expenditure were kept, one showing the actual cost of the Census, i.e., the administrative account, the other showing the amounts debited to the Census allotment, i.e., a financial account.

According to the former account the Census has actually cost Rs. 2,39,209 for both Provinces, or Rs. 10 annas 10 pies 5 for each 1,000 or 17 of an anna (say a sixth of a penny), per head of the population enumerated.

As compared with 1891.—Comparison with the Census account of 1891 can only be effected on the basis of the financial account. For this the Accountant General's Office is responsible, but the system of account being complicated precise accuracy is not attainable. Moreover there was in that office a disposition to regard the Census as a branch of the Civil Veterinary Department and as dependent on the Agri-Horticultural Gardens of Lahore, views which may have caused a little confusion. However according to the financial account the Census of 1901 cost Rs. 1,89,128 as against Rs. 2,03,645 in 1891.

This is not a satisfactory result. With the slip system of abstraction the cost should have been less, but there were certain causes which prevented the reduction hoped for. In the first place it was found necessary to rent expensive (and wholly unsuitable) buildings at Lahore for the abstraction office, although we could have decentralized the work with perfect safety. Further we had to import our abstractors and pay them travelling allowances—a heavy item. Apart from these details, however, the abstraction was cheap. But when we came to the compilation we met with difficulties. No sooner were the tables compiled, (and some had actually gone to press), when we received orders to compile data for the North-West Frontier Province. This necessitated our re-tabulating the data for 33 villages of Dera Ghazi Khan transferred to other Districts, and then re-compiling the District totals. This having been done the Provincial totals had to be divided into three and the tables re-copied.

Had these difficulties been anticipated we should have arranged for a specially selected staff to carry on the work. As it was for the abstraction work very few officials had been called in from Districts, and as soon as it was finished those few were allowed to return. This mistaken act of benevolence to District Officers left us with few experienced hands to cope with the new complications which arose, and greatly delayed the work.

The changes of area involved in the Chenab Colony were fairly simple, as the District boundaries of Jhang, etc., remained practically unaltered. But the changes, consequent on the formation of the new Frontier Province, led to inextricable confusion. From a census point of view the transfer of a slice of territory containing a few villages matters little, as the change may be disregarded, but the transfer of a Tahsii is anathema maranatha, for the factor is too large to be ignored. Thus the formation of the new district of Mianwali, to which we endeavoured to give complete census data, involved the expenditure of much time and trouble in the compilation of the returns.

Again there were certain special items of expenditure. We censused the Malakand garrisons, Kurram and the Shiranni country, which were not enumerated in 1891. In the Chenab Colony Rs. 1,346 had to be spent in paying enumerators as the Revenue staff was hopelessly inadequate and the Canal Department was unable to render us any assistance. Over Rs. 1,000 were also spent on providing for the storage of census records which should save some trouble and expense at the next enumeration.

Lastly, it looks quite easy to condense statistics, but it is not so. Condensation requires specially trained men and should not be attempted with an amateur staff. With these points I hope to deal further in the administration report on the census.

INDEX

(TO REPORT AND TABLES).
